

GENERAL DESCRIPTION - FRONT AXLE

The Massey Ferguson four wheel drive front axle is driven by a drive shaft along the left-hand side of the tractor from a transfer gearbox bolted to the side of the rear center housing. The transfer gearbox contains the reduction gears and clutch to control the engagement and disengagement of the front axle.

The front axle has the crownwheel and pinion and differential mounted on the left-hand side of the axle to align with the drive shaft making it a side-drive arrangement.

The drive is taken through a standard crownwheel and pinion and differential arrangement. The crownwheel is mounted on the left-hand side of the differential. The differential contains a cross with four differential bevel gears, these mesh with two side bevel gears to which the inner ends of the drive shafts are splined.

The drive shafts transmit the power through double universal joints at the steering pivot to the epicyclic reduction units in the front wheels. The front axle is attached to the front support casting by means of a center pivot pin in a similar manner to the two wheel drive axle.
