in Mountain Streams Mark G. Smelser,John C. Schmidt,1998 Successful management of water in mountain streams by the
USDA Forest Service requires that the link between resource development and channel change be documented and
quantified The characteristics of that linkage are unclear in mountain streams and the adjustability of these streams to land
use and hydrologic change has been argued in court One way to quantify the adjustability of a stream is to examine its
geomorphic history An excellent source of historic geomorphic data are the records associated with stream gaging stations
maintained by the U S Geological Survey This report describes what records are available how to organize the data on
computer spreadsheets and discusses 6 techniques that quantify the spatial and temporal magnitude of historic channel
adjustments The discharge measurements include physical measurements of the channel In particular USGS discharge
measurements include physical measurements of the channel By analyzing these measurements collectively it is possible to
quantify monthly annual and decadal scales of adjustment Once the history of channel adjustment is determined it can be
compared to histories of climate change flow regulation and land use These comparisons may link the geomorphic
adjustments to particular patterns events or activities Resource managers can use this knowledge to better assess the
ramifications of resource development land use and restoration efforts on mountain stream systems *McGraw-Hill Concise*
