**Computational Aerodynamic Modeling of Aerospace Vehicles** Mehdi Ghoreyshi, Karl Jenkins, 2019-03-08 Currently the use of computational fluid dynamics CFD solutions is considered as the state of the art in the modeling of unsteady nonlinear flow physics and offers an early and improved understanding of air vehicle aerodynamics and stability and control characteristics This Special Issue covers recent computational efforts on simulation of aerospace vehicles including fighter aircraft rotorcraft propeller driven vehicles unmanned vehicle projectiles and air drop configurations The complex flow physics of these configurations pose significant challenges in CFD modeling Some of these challenges include prediction of vortical flows and shock waves rapid maneuvering aircraft with fast moving control surfaces and interactions between propellers and wing fluid and structure boundary layer and shock waves Additional topic of interest in this Special Issue is the use of CFD tools in aircraft design and flight mechanics The problem with these applications is the computational cost involved particularly if this is viewed as a brute force calculation of vehicle s aerodynamics through its flight envelope To make progress in routinely using of CFD in aircraft design methods based on sampling model updating and system identification should be considered

**The Least-Squares Finite Element Method** Bo-nan Jiang, 2013-03-14 Here is a comprehensive introduction to the least squares finite element method LSFEM for numerical solution of PDEs It covers the theory for first order systems particularly the div curl and the div curl grad system Then LSFEM is applied systematically to permissible boundary conditions for the incompressible Navier Stokes equations to show that the divergence equations in the Maxwell equations are not redundant and to derive equivalent second order versions of the Navier Stokes equations and the Maxwell equations LSFEM is simple efficient and robust and can solve a wide range of problems in fluid dynamics and electromagnetics including incompressible viscous flows rotational inviscid flows low Mach number compressible flows two fluid and convective flows scattering waves etc

**Computation of Viscous Incompressible Flows** Dochan Kwak, Cetin C. Kiris, 2010-12-14 This monograph is intended as a concise and self contained guide to practitioners and graduate students for applying approaches in computational fluid dynamics CFD to real world problems that require a quantification of viscous incompressible flows In various projects related to NASA missions the authors have gained CFD expertise over many years by developing and utilizing tools especially related to viscous incompressible flows They are looking at CFD from an engineering perspective which is especially useful when working on real world applications From that point of view CFD requires two major elements namely methods algorithm and engineering physical modeling As for the methods CFD research has been performed with great successes In terms of modeling simulation mission applications require a deeper understanding of CFD and flow physics which has only been debated in technical conferences and to a limited scope This monograph fills the gap by

offering in depth examples for students and engineers to get useful information on CFD for their activities The procedural details are given with respect to particular tasks from the authors field of research for example simulations of liquid propellant rocket engine subsystems turbo pumps and the blood circulations in the human brain as well as the design of artificial heart devices However those examples serve as illustrations of computational and physical challenges relevant to many other fields Unlike other books on incompressible flow simulations no abstract mathematics are used in this book Assuming some basic CFD knowledge readers can easily transfer the insights gained from specific CFD applications in engineering to their area of interest

**Recent Numerical Advances in Fluid Mechanics** Omer San,2020-07-03 In recent decades the field of computational fluid dynamics has made significant advances in enabling advanced computing architectures to understand many phenomena in biological geophysical and engineering fluid flows Almost all research areas in fluids use numerical methods at various complexities from molecular to continuum descriptions from laminar to turbulent regimes from low speed to hypersonic from stencil based computations to meshless approaches from local basis functions to global expansions as well as from first order approximation to high order with spectral accuracy Many successful efforts have been put forth in dynamic adaptation strategies e g adaptive mesh refinement and multiresolution representation approaches Furthermore with recent advances in artificial intelligence and heterogeneous computing the broader fluids community has gained the momentum to revisit and investigate such practices This Special Issue containing a collection of 13 papers brings together researchers to address recent numerical advances in fluid mechanics
