Vaheed Nezhadali,2016-05-30 Heavy duty powertrains are complex systems with components from various domains different
response times during transient operations and different efficient operating ranges To ensure efficient transient operation of
a powertrain e g with low fuel consumption or short transient duration it is important to come up with proper control
strategies In this dissertation optimal control theory is used to calculate and analyze efficient heavy duty powertrain controls
during transient operations in different applications This is enabled by first developing control ready models usable for multi
phase optimal control problem formulations and then using numerical optimal control methods to calculate the optimal
transients Optimal control analysis of a wheel loader operating in a repetitive loading cycle is the first studied application
Increasing fuel efficiency or reducing the operation time in such repetitive loading cycles sums up to large savings over
longer periods of time Load lifting and vehicle traction consume almost all of the power produced by a diesel engine during
wheel loader operation Physical models are developed for these subsystems where the dynamics are described by differential
equations The model parameters are tuned and fuel consumption estimation is validated against measured values from real
wheel loader operation The sensitivity of wheel loader trajectory with respect to constrains such as the angle at which the
wheel loader reaches the unloading position is also analyzed A time and fuel optimal trajectory map is calculated for various
unloading positions Moreover the importance of simultaneous optimization of wheel loader trajectory and the component
transients is shown via a side to side comparison between measured fuel consumption and trajectories versus optimal control
results In another application optimal control is used to calculate efficient gear shift controls for a heavy duty Automatic
Transmission system A modeling and optimal control framework is developed for a nine speed automatic transmission
Solving optimal control problems using the developed model time and jerk efficient transient for simultaneous
disengagement of off going and engagement of in coming shift actuators are obtained and the results are analyzed Optimal
controls of a diesel electric powertrain during a gear shift in an Automated Manual Transmission system are calculated and
analyzed in another application of optimal control The powertrain model is extended by including driveline backlash angle as
an extra state in the system This is enabled by implementation of smoothing techniques in order to describe backlash
dynamics as a single continuous function during all gear shift phases Optimal controls are also calculated for a diesel electric
powertrain corresponding to a hybrid bus during a tip in maneuver It is shown that for optimal control analysis of complex
powertrain systems minimizing only one property such as time pushes the system transients into extreme operating

conditions far from what is achievable in real applications Multi objective optimal control problem formulations are suggested in order to obtain a compromise between various objectives when analyzing such complex powertrain systems
