### Pharmacokinetics

- The process of drug movement throughout the body necessary to achieve drug action.
- What the body does to the drug
- Composed of four processes:
  1. Absorption
  2. Distribution
  3. Metabolism
  4. Excretion
- **Drug absorption**
  - The movement of the drug into the bloodstream after administration.
  - Approximately 80% of drugs are taken by mouth (enteral).
    - These are the only drugs to pass through the GI tract
    - For the body to use drugs taken by mouth, a drug in a solid form (e.g., tablet or capsule) must disintegrate into small particles and combine with a liquid to form a solution, a process known as *dissolution* (drugs in a liquid form are already in solution), to be absorbed from the GI tract into the bloodstream
  - Tablets are not 100% drug. Fillers and inert substances – such as simple syrup, vegetable gums, aromatic powder, honey, and various elixirs – called *excipients* are used in drug preparation to allow the drug to take on a particular size and shape and to enhance drug dissolution.
  - **Disintegration** - Breakdown of oral drug form into small particles
  - **Dissolution** - Combining small drug particles with liquid to form a solution
    - The rate of dissolution is the time it takes the drug to disintegrate and dissolve to become available for the body to absorb it.
