Linear Algebra and Its Applications David C. Lay,2011-11-21 Linear algebra is relatively easy for students during the early stages of the course when the material is presented in a familiar concrete setting But when abstract concepts are introduced students often hit a brick wall Instructors seem to agree that certain concepts such as linear independence spanning subspace vector space and linear transformations are not easily understood and require time to assimilate Since they are fundamental to the study of linear algebra students understanding of these concepts is vital to their mastery of the subject David Lay introduces these concepts early in a familiar concrete Rn setting develops them gradually and returns to them again and again throughout the text so that when discussed in the abstract these concepts are more accessible Note This is the standalone book if you want the book access card order the ISBN below 0321399145 9780321399144 Linear Algebra plus MyMathLab Getting Started Kit for Linear Algebra and Its Applications Package consists of 0321385179 9780321385178 Linear Algebra and Its Applications 0321431308 9780321431301 MyMathLab MyStatLab Glue in Access Card 0321654064 9780321654069 MyMathLab Inside Star Sticker Discrete Maths and Its Applications Global Edition 7e Kenneth Rosen,2012-09-16 We are pleased to present this Global Edition which has been developed specifically to meet the needs of international students of discrete mathematics In addition to great depth in key areas and a broad range of real world applications across multiple disciplines we have added new material to make the content more relevant and improve learning outcomes for the international student This Global Edition includes An entire new chapter on Algebraic Structures and Coding Theory New and expanded sections within chapters covering Foundations Basic Structures and Advanced Counting Techniques Special online only chapters on Boolean Algebra and Modeling Computation New and revised problems for the international student integrating alternative methods and solutions This Global Edition has been adapted to meet the needs of courses outside of the United States and does not align with the instructor and student resources available with the US edition Linear Algebra with Applications Gareth Williams,2012-09-04 Updated and revised to increase clarity and further improve student learning the Eighth Edition of Gareth Williams classic text is designed for the introductory course in linear algebra It provides a flexible blend of theory and engaging applications for students within engineering science mathematics business management and physics It is organized into three parts that contain core and optional sections There is then ample time for the instructor to select the material that gives the course the desired flavor Part 1 introduces the basics presenting systems of linear equations vectors and subspaces of Rn matrices linear transformations determinants and eigenvectors Part 2 builds on the material presented in Part1 and goes on to introduce the concepts of general vector spaces discussing properties of bases developing the rank nullity theorem and introducing spaces of matrices and functions Part 3 completes the course with important ideas and methods of numerical linear algebra such as ill conditioning pivoting and LU decomposition Throughout the text the author takes care to fully and clearly develop the mathematical concepts and provide modern applications to reinforce those concepts The applications range from theoretical applications within differential equations and least square analysis to practical applications in fields such as archeology demography electrical engineering and more New exercises can be found throughout that tie back to the modern examples in the text Key Features of the Eighth Edition Updated and revised throughout with new section material and exercises Each section begins with a motivating introduction which ties material to the previously learned topics Carefully explained examples illustrate key concepts throughout the text Includes such new topics such as QR Factorization and Singular Value Decomposition Includes new applications such as a Leslie Matrix model that is used to predict birth and death patterns of animals Includes discussions of the role of linear algebra in many areas such as the operation of the search engine Google and the global structure of the worldwide air transportation network A MATLAB manual that ties into the regular course material is included as an appendix These ideas can be implemented on any matrix algebra software package This manual consists of 28 sections that tie into the regular course material Graphing Calculator Manual included as an appendix A Student Solutions Manual that contains solutions to selected exercises is available as a supplement An Instructors Complete Solutions Manual test bank and PowerPoint Lecture Outlines are also available Available with WebAssign Online Homework Assessment

Anil Nerode,Noam Greenberg,2023-01-16 The theory relating algebraic curves and Riemann surfaces exhibits the unity of mathematics topology complex analysis algebra and geometry all interact in a deep way This textbook offers an elementary introduction to this beautiful theory for an undergraduate audience At the heart of the subject is the theory of elliptic functions and elliptic curves A complex torus or donut is both an abelian group and a Riemann surface It is obtained by identifying points on the complex plane At the same time it can be viewed as a complex algebraic curve with addition of points given by a geometric chord and tangent method This book carefully develops all of the tools necessary to make sense of this isomorphism The exposition is kept as elementary as possible and frequently draws on familiar notions in calculus and algebra to motivate new concepts Based on a capstone course given to senior undergraduates this book is intended as a textbook for courses at this level and includes a large number of class tested exercises The prerequisites for using the book are familiarity with abstract algebra calculus and analysis as covered in standard undergraduate courses **Computational Electromagnetics** Raj Mittra,2013-08-20 Emerging Topics in Computational Electromagnetics in Computational Electromagnetics presents advances in Computational Electromagnetics This book is designed to fill the existing gap in current CEM literature that only cover the conventional numerical techniques for solving traditional EM problems The book examines new algorithms and applications of these algorithms for solving problems of current interest that are not readily amenable to efficient treatment by using the existing techniques The authors discuss solution techniques for problems arising in nanotechnology bioEM metamaterials as well as multiscale problems They present techniques that utilize recent advances in computer technology such as parallel architectures and the increasing need to solve large and complex problems in a time efficient manner by using highly scalable algorithms Financial Data Analytics with Machine Learning, Optimization and Statistics Sam follows as well as other important topics in financial data driven aspects such as Principal Component Analysis PCA and recommender systems with their applications as well as advanced regression learners such as kernel regression and logistic regression with discussions on model assessment methods such as simple Receiver Operating Characteristic ROC curves and Area Under Curve AUC for typical classification problems The book then moves on to other commonly used machine learning tools like linear classifiers such as perceptrons and their generalization the multilayered counterpart MLP Support Vector Machines SVM as well as Classification and Regression Trees CART and Random Forests Subsequent chapters focus on linear Bayesian learning including well received credibility theory in actuarial science and functional kernel regression and non linear Bayesian learning such as the Na ve Bayes classifier and the Comonotone Independence Bayesian Classifier CIBer recently independently developed by the authors and used successfully in InsurTech After an in depth discussion on cluster analyses such as K means clustering and its inversion the K nearest neighbor KNN method the book concludes by introducing some useful deep neural networks for FinTech like the potential use of the Long Short Term Memory model LSTM for stock price prediction This book can help readers become well equipped with the following skills To evaluate financial and insurance data quality and use the distilled knowledge obtained from the data after applying data analytic tools to make timely financial decisions To apply effective data dimension reduction tools to enhance supervised learning To describe and select suitable data analytic tools as introduced above for a given dataset depending upon classification or regression prediction purpose The book covers the competencies tested by several professional examinations such as the Predictive Analytics Exam offered by the Society of Actuaries
