Introduction to Computational Optimization Models for Production Planning in a Supply Chain Stefan Voß,David L. Woodruff,2006-03-20 provide models that could be used by do it yourselves and also can be used to provide understanding of the background issues so that one can do a better job of working with the proprietary algorithms of the software vendors In this book we strive to provide models that capture many of the tails faced by rms operating in a modern supply chain but we stop short of proposing models for economic analysis of the entire multi player chain In other words we produce models that are useful for planning within a supply chain rather than models for planning the supply chain The usefulness of the models is enhanced greatly by the fact that they have been implemented in computer modeling languages Implementations are shown in Chapter 7 which allows solutions to be found using a computer A reasonable question is why write the book now It is a combination of opportunities that have recently become available The availability of modeling languages and computers that provide the opportunity to make practical use of the models that we develop Meanwhile software companies are providing software for optimized production planning in a supply chain The opportunity to make use of such software gives rise to a need to understand some of the issues in computational models for optimized planning This is best done by considering simple models and examples
