Cerebral gliomas account for 45% of all primary central nervous system (CNS) tumors. The median survival after the initial diagnosis of glioblastoma (GBM) is only 15 months, and less than 10% of patients survive three years post-diagnosis. Surgical treatment followed by adjuvant therapies such as radiotherapy and chemotherapy represents the classical strategy in glioma management. The revised WHO 2016 classification now distinguishes the oligodendrogliomas with 1p19q codeletion and IDH mutation from the astrocytomas with or without IDH mutations, thereby creating homogenous and pathologically distinct subgroups.
