Computational, Geometric, and Process Perspectives on Facial Cognition

Michael J. Wenger, James T. Townsend, 2005-04-11 Within the last three decades interest in the psychological experience of human faces has drawn together cognitive science researchers from diverse backgrounds. Computer scientists talk to neural scientists who draw on the work of mathematicians who explicitly influence those conducting behavioral experiments. The chapters in this volume illustrate the breadth of the research on facial perception and memory with the emphasis being on mathematical and computational approaches. In pulling together these chapters the editors sought to do much more than illustrate breadth. They endeavored as well to illustrate the synergies and tensions that inevitably result from adopting a broad view, one consistent with the emerging discipline of cognitive science. **South Africa Yearbook**, 2009

The Evolution of Rhythm Cognition: Timing in Music and Speech Andrea Ravignani, Henkjan Honing, Sonja A. Kotz, 2018-07-24 Human speech and music share a number of similarities and differences. One of the closest similarities is their temporal nature as both i) develop over time ii) form sequences of temporal intervals possibly differing in duration and acoustical marking by different spectral properties which are perceived as a rhythm and iii) generate metrical expectations. Human brains are particularly efficient in perceiving producing and processing fine rhythmic information in music and speech. However a number of critical questions remain to be answered. Where does this human sensitivity for rhythm arise? How did rhythm cognition develop in human evolution? How did environmental rhythms affect the evolution of brain rhythms? Which rhythm specific neural circuits are shared between speech and music or even with other domains?

Evolutionary processes long time scales often prevent direct observation understanding the psychology of rhythm and its evolution requires a close fitting integration of different perspectives First empirical observations of music and speech in the field are contrasted and generate testable hypotheses Experiments exploring linguistic and musical rhythm are performed across sensory modalities ages and animal species to address questions about domain specificity development and an evolutionary path of rhythm Finally experimental insights are integrated via synthetic modeling generating testable predictions about brain oscillations underlying rhythm cognition and its evolution Our understanding of the cognitive neurobiological and evolutionary bases of rhythm is rapidly increasing However researchers in different fields often work on parallel potentially converging strands with little mutual awareness This research topic builds a bridge across several disciplines focusing on the cognitive neuroscience of rhythm as an evolutionary process It includes contributions encompassing although not limited to 1 developmental and comparative studies of rhythm e g critical acquisition periods innateness 2 evidence of rhythmic behavior in other species both spontaneous and in controlled experiments 3 comparisons of rhythm processing in music and speech e g behavioral experiments systems neuroscience perspectives on music speech networks 4 evidence on rhythm processing across modalities and domains 5 studies on rhythm in interaction and context social affective etc 6 mathematical and computational e g connectionist symbolic models of rhythmicity as an evolved behavior

Speech Processing in the Auditory System Steven Greenberg, William A. Ainsworth, Richard R. Fay, 2006-05-09 Although speech is the primary behavioral medium by which humans communicate its

auditory basis is poorly understood having profound implications on efforts to ameliorate the behavioral consequences of hearing impairment and on the development of robust algorithms for computer speech recognition In this volume the authors provide an up to date synthesis of recent research in the area of speech processing in the auditory system bringing together a diverse range of scientists to present the subject from an interdisciplinary perspective Of particular concern is the ability to understand speech in uncertain potentially adverse acoustic environments currently the bane of both hearing aid and speech recognition technology There is increasing evidence that the perceptual stability characteristic of speech understanding is due at least in part to elegant transformations of the acoustic signal performed by auditory mechanisms As a comprehensive review of speech s auditory basis this book will interest physiologists anatomists psychologists phoneticians computer scientists biomedical and electrical engineers and clinicians
