Differential Equations Christian Constanda, 2017-03-14 This textbook is designed with the needs of today's student in mind It is the ideal textbook for a first course in elementary differential equations for future engineers and scientists including mathematicians This book is accessible to anyone who has a basic knowledge of precalculus algebra and differential and integral calculus Its carefully crafted text adopts a concise simple no frills approach to differential equations which helps students acquire a solid experience in many classical solution techniques With a lighter accent on the physical interpretation of the results a more manageable page count than comparable texts a highly readable style and over 1000 exercises designed to be solved without a calculating device this book emphasizes the understanding and practice of essential topics in a succinct yet fully rigorous fashion Apart from several other enhancements the second edition contains one new chapter on numerical methods of solution The book formally splits the pure and applied parts of the contents by placing the discussion of selected mathematical models in separate chapters At the end of most of the 246 worked examples the author provides the commands in Mathematica for verifying the results The book can be used independently by the average student to learn the fundamentals of the subject while those interested in pursuing more advanced material can regard it as an easily taken first step on the way to the next level Additionally practitioners who encounter differential equations in their professional work will find this text to be a convenient source of reference

A Biologist's Guide to Mathematical Modeling in Ecology and Evolution Sarah P. Otto, Troy Day, 2011-09-19 Thirty years ago biologists could get by with a rudimentary grasp of mathematics and modeling Not so today In seeking to answer fundamental questions about how biological systems function and change over time the modern biologist is as likely to rely on sophisticated mathematical and computer based models as traditional fieldwork In this book Sarah Otto and Troy Day provide biology students with the tools necessary to both interpret models and to build their own The book starts at an elementary level of mathematical modeling assuming that the reader has had high school mathematics and first year calculus Otto and Day then gradually build in depth and complexity from classic models in ecology and evolution to more intricate class structured and probabilistic models The authors provide primers with instructive exercises to introduce readers to the more advanced subjects of linear algebra and probability theory Through examples they describe how models have been used to understand such topics as the spread of HIV chaos the age structure of a country speciation and extinction Ecologists and evolutionary biologists today need enough mathematical training to be able to assess the power and limits of biological models and to develop theories and models themselves This innovative book will be an indispensable guide to the world of mathematical models for the next generation of biologists A how to guide for developing new mathematical models in biology Provides step by step recipes for constructing and analyzing models Interesting biological applications Explores classical models in ecology and evolution Questions at the end of every chapter
