Banana: Genomics and Transgenic Approaches for Genetic Improvement Sukhada Mohandas, Kundapura V. Ravishankar, 2016-09-08 Bananas and plantains are among the most important food and cash crops in the world They are cultivated in more than 135 countries across the tropics and subtropics with an annual global production of ca 130 million metric tonnes Though bananas are one of the most important components of food security in many developing countries banana production is threatened by both abiotic and biotic stresses These include a wide range of diseases and pests such as bunchy top virus burrowing nematodes black Sigatoka or black leaf streak Fusarium wilt etc In recent years considerable progress has been made and several biotechnological and genomic tools have been employed to help understand and unravel the mysterious banana genome Molecular and genomic studies have helped to decipher the Musa genome and its evolution Genetic linkage map and whole genome sequencing of both Musa acuminata and Musa balbisiana progenitors of cultivated banana have completely changed the way of thinking and the approach on banana crop improvement Whole genome sequencing has helped to improve the selection of quantitative traits such as yield as well as the selection of optimal parents for developing required hybrids in breeding programs Gene isolation and the analysis of mutants have helped in the characterization of genes of agronomic value and the associated regulatory sequences With the advent of molecular markers and new statistical tools it is now possible to measure the diversity identify genes and useful alleles linked to important agronomic traits Further these alleles can be incorporated into cultivars through marker assisted selection or through transgenic approach Transgenic approaches are potential tools for direct transfer of these genes into popular cultivars which are generally not amenable for conventional breeding techniques in specific with crops such as bananas which are sterile triploid and heterozygous thereby making it difficult to reconstruct the recurrent genotypes in banana Transgenic techniques thus have helped overcome the difficulty of working with sterile triploid banana crop In the last five years enormous amount

of new information and techniques have been generated for banana A comprehensive book entitled Banana Genomics and Transgenic Approaches for Genetic improvement on banana genomics latest transgenic technologies and tools available for improved crop development in banana will address all these requirements

The effect of muscle pathogenesis on avian physiology, animal welfare, and quality of muscle as a food Wei Guo, Sandra G. Velleman, Gale M. Strasburg, 2025-05-15 Over the past several decades the poultry industry has achieved huge improvements in global poultry production including with increased growth performance improved body composition higher market weight increased feed efficiency reduced production costs and increased profitability for growers These gains have resulted from a combination of intensive genetic selection tailored nutritional approaches and novel poultry management strategies However these improvements in broiler chicken and turkey production have also come with costs These costs include increased susceptibility to environmental stress increased mortality in commercial poultry flocks and muscle pathogenesis ultimately leading to deleterious effects on meat quality traits affecting appearance texture and protein functionality For example a subset of fast growing domestic turkeys develops spontaneous cardiomyopathy or round heart disease that leads to a mortality rate up to 15% at 2 to 4 weeks of age Even turkeys that survive the critical first two weeks after hatch already have damaged hearts at a prevalence of 80% to 90% which may lead to growth retardation during the grow out phase This syndrome can also occur in broiler chickens which causes major

economic losses and limits the maximum profitability in the poultry industry world wide Another example is wooden breast an abnormal muscle condition resulting in a hardening of the breast muscle affecting meat texture Other examples include green muscle disease also known as deep pectoral muscle myopathy spaghetti meat and white striping All of these pathologies include the development of myopathic changes subsequently affecting meat quality leading to consumer complaints and economic losses by the processing industry There is a paucity of information on the etiologies of broiler and turkey muscle pathogenesis and their consequent effects on muscle physiology This Research Topic will highlight the mechanisms of skeletal and cardiac muscle pathogenesis in poultry that are responsible for premature bird mortality and altered quality of muscle as a food This research topic will cover the recent findings in the area of myopathies in poultry Original Research and Review papers among other article types are welcome to be submitted to this collection
