## Chemistry Classwork: Electron Energy and Light

From fireworks to stars, the color of light is useful in finding out what's in space. The emission of light by hydrogen and other atoms has played a key role in understanding the electronic structure of atoms. Trace materials, such as evidence from a crime scene, lead in paint or mercury in drinking water, can be identified by heating or burning the materials and measuring the color(s) of light given off in the flame or bright-line spectra.

### Model 1 – White Light

- Trace the arrows in Model 1 and shade in the table with colored pencils where appropriate.
  - What happens to white light when it passes through a prism?
  - Why are the color labels in the table in Model 1 plural (i.e., "Reds" rather than "Red")?
  - Do all colors of light travel at the same speed?
  - Do all colors of light have the same energy? If no, which colors have the highest energy and the least energy, respectively?
- ➡ 6. Consider the light illustrated in Model 1.
- Which color corresponds to the longest wavelength?
  - Which color corresponds to the shortest wavelength?
  - Write a sentence that describes the relationship between wavelength and energy of light.

**Photon and Electron Collisions with Atoms and Molecules** Philip G. Burke, Charles J. Joachain, 2012-12-06 Research on photon and electron collisions with atomic and molecular targets and their ions has seen a rapid increase in interest both experimentally and theoretically in recent years This is partly because these processes provide an ideal means of investigating the dynamics of many particle systems at a fundamental level and partly because their detailed understanding is required in many other fields particularly astrophysics plasma physics and controlled thermonuclear fusion laser physics atmospheric processes isotope separation radiation physics and chemistry and surface science In recent years a number of important advances have been made both on the experimental side and on the theoretical side On the experimental side

these include absolute measurements of cross sections experiments using coincidence techniques the use of polarised beams and targets the development of very high energy resolution electron beams the use of synchrotron radiation sources and ion storage rings the study of laser assisted atomic collisions the interaction of super intense lasers with atoms and molecules and the increasing number of studies using positron beams      **Lasers and Light** Arthur L.
