

# Gene Expression—Transcription

How is mRNA synthesized and what message does it carry?

## Why?

DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

*Endoplasmic Reticulum Stress Response and Transcriptional Reprogramming* Kezhong Zhang, 2015 Endoplasmic reticulum ER is an intracellular organelle responsible for protein folding and assembly lipid and sterol biosynthesis and calcium storage A number of biochemical physiological or pathological stimuli can interrupt protein folding process causing accumulation of unfolded or misfolded proteins in the ER lumen a condition called ER stress To cope with accumulation of unfolded or misfolded proteins the ER has evolved a group of signaling pathways termed Unfolded Protein Response UPR or ER stress response to align cellular physiology To maintain ER homeostasis transcriptional regulation mediated through multiple UPR branches is orchestrated to increase ER folding capacity reduce ER workload and promote degradation of misfolded proteins In recent years accumulating evidence suggests that ER stress triggered transcriptional reprogramming exists in many pathophysiological processes and plays fundamental roles in the initiation and progression of a variety of diseases such as metabolic disease cardiovascular disease neurodegenerative disease and cancer Understanding effects and mechanisms of ER stress associated transcriptional reprogramming has high impact on many areas of molecular genetics and will be particularly informative to the development of pharmacologic avenues towards the prevention and treatment of modern common human diseases by targeting the UPR signaling For these reasons ER stress response and transcriptional reprogramming are a timely and necessary topic of

discussion for Frontiers in Genetics The important topics in this area include but not limited to 1 ER resident transcription factors and their involvements in ER stress response and cell physiology 2 Physiologic roles and molecular mechanisms of ER stress associated transcriptional regulation in lipid and glucose metabolism 3 In vitro and in vivo models for ER stress associated transcriptional reprogramming 4 ER stress associated transcriptional regulation in human disease 5 Therapeutic potentials by targeting ER stress response pathways

**The Topological Model of Genome and Evolution** Pradeep Chhaya, 2023-09-19 This book deals with the missing link in the domain of functional genomics viz genomic architecture It begins with a deconstruction of the Darwinian paradigm using the proposed model of modified involuted manifolds It recasts the process of natural selection as a process of information transfer Using a topological model this book outlines a new genomic architecture The key argument for this

proposed model is that some such structuralism has always been implicit in genomics. The proposed model fits very well with the known genomic characteristics and allows to separate the regulatory genome from the transcriptive genomes. The model is capable of discerning modular architecture of genomes with different genomic functionalities existing in hierarchical relationships and demonstrates that genomes act as units of selection and as the environment for the individual genes which act as competing species. Towards the end the book also examines the role of genomic evolution in cancer and the principles of natural selection and evolution of the genotype. The regulatory genome is also discussed with an emphasis on its evolution and natural selection. It is a valuable source for researchers working in functional genomics, mathematical modeling in biology and evolutionary genomics.
