

Gene Expression—Transcription

How is mRNA synthesized and what message does it carry?

Why?

DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

Cell Biology: Gene expression: translation and the behavior of proteins David M. Prescott, Lester Goldstein, 1980

Cell Biology A Comprehensive Treatise V4 David M. Prescott, 2012-12-02 Cell Biology A Comprehensive Treatise Volume 4 Gene Expression Translation and the Behavior of Proteins discusses the translation of genetic information into proteins. It also explains the activities and behaviors of proteins which is the final stage of gene expression. This book opens with a discussion of the components and mechanism of the translational machinery, their structures, biogenesis, and cellular levels. It then explains the protein synthesis wherein each chapter focuses on one aspect of the detailed process. Other topics covered in this book are the structure and function of cytoplasmic ribonucleoprotein complexes and the proteolytic cleavage in the posttranslational processing of proteins. This text also covers the regulation of enzyme activity and the movement of material between nucleus and cytoplasm. The last three chapters are more in depth discussions on protein synthesis, intracellular transport, regulation, and secretion. As with the other volumes of this book series, readers will definitely benefit from the vast information provided in this book regarding protein, its activities, behaviors, and synthesis. Plastid Biology Steven M. Theg, Francis-André Wollman, 2014-09-19 Plastids are the sites of conversion of solar energy into the chemical energy usable to sustain life. They are also responsible for the production of the vast majority of the oxygen in the atmosphere. Through these activities, they play a unique role in the biosphere, producing two critical products upon which life on Earth depends. It covers in 21 chapters nearly all actively investigated areas of plastid biology, from biosynthesis to function to their uses in biotechnology. The editors have compiled an extensive list of international experts from whom to solicit chapters. As is evident from the suggested Table of Contents, the book will start with a discussion of genetic material and its expression, followed by differentiation and development of different plastid types and internal organization. This is followed by an in depth look at biogenesis and assembly of plastid proteins and protein complexes, and then by the important metabolic functions in plastids. The book will end with two chapters discussing the role of plastid biology in protein expression, biotechnology, and in hydrogen and biofuel production. **Gene Expression in Field Crops** Janet Saunders, 1993 *Gene Expression and Regulation in Mammalian Cells* Fumiaki Uchiumi, 2018-02-21 Central dogma was presented by Dr. Francis Crick 60 years ago. The information of nucleotide sequences on DNAs is transcribed into RNAs by RNA polymerases. We learned the mechanisms of how transcription determines function of proteins and behaviour of cells, and even how it brings appearances of organisms. This book is intended for scientists and medical researchers, especially who are interested in the relationships between transcription and human diseases. This volume consists of an introductory chapter and 14 chapters divided into 4 parts. Each chapter is written by experts in the basic scientific field. A collection of articles presented by active and laboratory based investigators provides recent advances and progresses in the field of transcriptional regulation in mammalian cells. *Gene Expression in Horticultural Crops* Robert D. Post-Transcriptional Control of Gene Expression in Plants Witold Filipowicz, Thomas Hohn, 2012-12-06 A recent volume of this series. Signals and Signal Transduction Pathways in Plants. K. Palme ed. Plant Molecular Biology 26:1237-1679 described the relay races by which signals are transported in plants from the sites of stimuli to the gene expression machinery of the cell. Part of this machinery, the transcription apparatus, has been well studied in the last two decades and many important mechanisms controlling gene expression at the transcriptional level have been elucidated. However, control of gene expression is by no means complete once the RNA has been produced. Important regulatory devices determine the maturation and usage of mRNA and the fate of its translation product. Post transcriptional regulation is especially important for generating a fast response to environmental and intracellular signals. This book summarizes recent progress in the area of post transcriptional regulation of gene expression in plants. 18 chapters of the book address problems of RNA processing and stability, regulation of translation, protein folding and degradation as well as intracellular and cell to cell transport of proteins and nucleic acids. Several chapters are devoted to the processes taking place in plant organelles.

Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria Frans J. de Bruijn, 2016-07-01 Bacteria in various habitats are subject to continuously changing environmental conditions such as nutrient deprivation, heat and cold stress, UV radiation, oxidative stress, desiccation, acid stress, nitrosative stress, cell envelope stress, heavy metal exposure, osmotic stress and others. In order to survive they have to respond to these

conditions by adapting their physiology through sometimes drastic changes in gene expression. In addition, they may adapt by changing their morphology, forming biofilms, fruiting bodies, or spores. Filaments of viable but not culturable (VBNC) cells or moving away from stress compounds via chemotaxis. Changes in gene expression constitute the main component of the bacterial response to stress and environmental changes and involve a myriad of different mechanisms, including alternative sigma factors, two or three component regulatory systems, small non-coding RNAs, chaperones, CRISPR-Cas systems, DNA repair, toxin-antitoxin systems, the stringent response, efflux pumps, alarmones, and modulation of the cell envelope or membranes, to name a few. Many regulatory elements are conserved in different bacteria, however, there are endless variations on the theme, and novel elements of gene regulation in bacteria inhabiting particular environments are constantly being discovered. Especially in pathogenic bacteria colonizing the human body, a plethora of bacterial responses to innate stresses such as pH, reactive nitrogen, and oxygen species, and antibiotic stress are being described. An attempt is made to not only cover model systems but give a broad overview of the stress-responsive regulatory systems in a variety of bacteria, including medically important bacteria, where elucidation of certain aspects of these systems could lead to treatment strategies of the pathogens. Many of the regulatory systems being uncovered are specific, but there is also considerable cross-talk between different circuits.

Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria is a comprehensive two-volume work bringing together both review and original research articles on key topics in stress and environmental control of gene expression in bacteria. Volume One contains key overview chapters as well as content on two, three component regulatory systems and stress responses, sigma factors and stress responses, small non-coding RNAs and stress responses, toxin-antitoxin systems and stress responses, stringent response to stress responses to UV irradiation, SOS and double-stranded systems repair systems and stress adaptation to both oxidative and osmotic stress and desiccation tolerance and drought stress. Volume Two covers heat shock responses, chaperonins and stress, cold shock responses, adaptation to acid stress, nitrosative stress and envelope stress, as well as iron homeostasis, metal resistance, quorum sensing, chemotaxis, and biofilm formation and viable but not culturable VBNC cells. Covering the full breadth of current stress and environmental control of gene expression studies and expanding it towards future advances in the field, these two volumes are a one-stop reference for non-medical molecular geneticists interested in gene regulation under stress.
