what is known and what is not known about environmental economics The book discusses why we have environmental problems and how we would optimally react if we had perfect information about environmental benefits and costs It then describes methods in use and their flaws to acquire the information necessary to enact environmental policy The book starts with a categorization of goods types concluding that environmental problems stem from non excludable goods that are either rivalrous or non rivalrous The author introduces the Coase Theorem in the first chapter then details how households and firms would behave when facing a zero price on pollution versus a price on pollution set equal to presumed known marginal damages He connects the economic system with the environmental system by aggregating up from individual decisions to the aggregate market system and the aggregate environmental quality But of course the information available is rarely perfect Clarifying the information difficulties faced by households firms and policy makers the author recognizes that there is both a knowledge gap and a communication gap He then covers the methods policy makers employ in an attempt to gain sufficient insight into marginal benefits and marginal costs to properly set a marginal damage tax properly limit emission rights or properly provide public goods The book then examines the nature of these methods and their likely bias before concluding that surviving the next 50 to 100 years will lead to a world of ever improving levels of economic and environmental goods but the sobering qualifier is that without proper environmental policies there is a significant probability that our species will not be able to reach that desirable outcome
