Young, 2006 A cipher is a scheme for creating coded messages for the secure exchange of information Throughout history many different coding schemes have been devised One of the oldest and simplest mathematical systems was used by Julius Caesar This is where Mathematical Ciphers begins Building on that simple system Young moves on to more complicated schemes ultimately ending with the RSA cipher which is used to provide security for the Internet This book is structured differently from most mathematics texts It does not begin with a mathematical topic but rather with a cipher The mathematics is developed as it is needed the applications motivate the mathematics As is typical in mathematics textbooks most chapters end with exercises Many of

these problems are similar to solved examples and are designed to assist the reader in mastering the basic material. A few of the exercises are of a kind intended to challenge the interested reader. Implementing encryption schemes is considerably easier with the use of the computer. For all the ciphers introduced in this book, JavaScript programs are available from the Web. In addition to developing various encryption schemes, this book also introduces the reader to number theory. Here the study of integers and their properties is placed in the exciting and modern context of cryptology. Mathematical Ciphers can be used as a textbook for an introductory course in mathematics for all majors. The only prerequisite is high school
