

INTRODUCTION

To help get the most power from your CB or ham transceiver, the antenna system should be operating efficiently. With the Micronta® SWR meter, you can easily measure the system's SWR. Then, by fine tuning the antenna for the lowest SWR reading, you can be assured that your transmitter puts out all the power it can.

This meter measures the efficiency of your antenna system by determining how closely the impedance of the antenna matches the impedance of the transmitter.

When coupled between the transmitter and the coaxial antenna feed cable, the meter monitors how effectively your transmitter's output is transferred to the antenna. The comparison of power sent to the antenna with power reflected back to the transmitter is known as the standing wave ratio.

You can also use the meter separately to measure the transmitter's field strength. This scale can help you to position your antenna for best output coverage. It can also provide the data you need to plot a map of the transmitter's power around the antenna.

MEASURING THE STANDING WAVE RATIO

Connecting the Meter

1. Disconnect the PL-259 connector of your antenna cable from the output terminal of your transceiver.
2. Connect the antenna cable to the meter's terminal marked ANT.

3. Connect a separate length of 50 ohm cable, such as type RG-58U, equipped with a PL-259 connector at each end, between the transceiver's output terminal and the meter's TRANS terminal.

Taking a Measurement

1. Move the FIND/REF toggle switch to the FIND position.
2. Push and hold the transmit button on your microphone, as if you were transmitting a signal normally.
3. While holding in the transmit button, rotate the calibration control until the meter's needle aligns with the CAL mark. Release the transmit button.
4. Move the FIND/REF switch to REF.
5. Press the microphone's transmit button again. The meter's needle moves up scale and rests on a number. This number is your SWR.

Note: Repeat the above steps for each channel you wish to measure.
