**Translocation:** A translocation is a rearrangement of segments of chromosomes. Translocations can be reciprocal, nonreciprocal, or reciprocal and nonreciprocal.

Three translocation scenarios are shown. (See the Gizmo HELP button for more information.)

1. Suppose you have mapped out a segment of a chromosome and found a mutation. How can you determine if the mutation is a translocation?

Yes, the location of the mutation and the location of the translocation are the same.

2. What do you think would happen if you released two translocation cells with each other?

They would produce up to four cells.

**Reciprocal Translocation:**

A reciprocal translocation is a type of translocation in which two non-homologous chromosomes exchange segments. This results in two chromosomes with segments from both original chromosomes.

The Gizmo shows a reciprocal translocation between two chromosomes. The chromosomes are labeled with their original segments. (See the Gizmo HELP button for more information.)
