Abstracts ,1986 **Using Algebraic Geometry** David A. Cox,John Little,DONAL OSHEA,2013-04-17 In recent years the discovery of new algorithms for dealing with polynomial equations coupled with their implementation on fast inexpensive computers has sparked a minor revolution in the study and practice of algebraic geometry These algorithmic methods have also given rise to some exciting new applications of algebraic geometry This book illustrates the many uses of algebraic geometry highlighting some of the more recent applications of Grobner bases and resultants In order to do this the authors provide an introduction to some algebraic objects and techniques which are more advanced than one typically encounters in a first course but nonetheless of great utility The book is written for nonspecialists and for readers with a diverse range of backgrounds It assumes knowledge of the material covered in a standard undergraduate course in abstract algebra and it would help to have some previous exposure to Grobner bases The book does not assume the reader is familiar with more advanced concepts such as modules *Spatial Models of Parliamentary Voting* Keith T. Poole,2005-04-11 This book presents a simple geometric model of voting as a tool to analyze parliamentary roll call data Each legislator is represented by one point and each roll call is represented by two points that correspond to the policy consequences of voting Yea or Nay On every roll call each legislator votes for the closer outcome point at least probabilistically These points form a spatial map that summarizes the roll calls In this sense a spatial map is much like a road map because it visually depicts the political world of a legislature The closeness of two legislators on the map shows how similar their voting records are and the distribution of legislators shows what the dimensions are These maps can be used to study a wide variety of topics including how political parties evolve over time the existence of sophisticated voting and how an executive influences legislative outcomes

Sibley, 2015-08-14 Thinking Geometrically A Survey of Geometries is a well written and comprehensive survey of college geometry that would serve a wide variety of courses for both mathematics majors and mathematics education majors Great care and attention is spent on developing visual insights and geometric intuition while stressing the logical structure historical development and deep interconnectedness of the ideas Students with less mathematical preparation than upper division mathematics majors can successfully study the topics needed for the preparation of high school teachers There is a multitude of exercises and projects in those chapters developing all aspects of geometric thinking for these students as well as for more advanced students These chapters include Euclidean Geometry Axiomatic Systems and Models Analytic Geometry Transformational Geometry and Symmetry Topics in the other chapters including Non Euclidean Geometry Projective Geometry Finite Geometry Differential Geometry and Discrete Geometry provide a broader view of geometry The different chapters are as independent as possible while the text still manages to highlight the many connections between topics The text is self contained including appendices with the material in Euclid s first book and a high school axiomatic system as well as Hilbert s axioms Appendices give brief summaries of the parts of linear algebra and multivariable calculus needed for certain chapters While some chapters use the language of groups no prior experience with abstract algebra is presumed The text will support an approach emphasizing dynamical geometry software without being tied to any particular software
