

## Understanding the Circular Flow of the Macroeconomy

Firms provide goods and services to households through the product market. Households pay firms for these goods and services.

Households supply firms with the factors of production (also called resources) through the factor market. Firms pay households for resources (land, labor, capital, and entrepreneurial skill).

The income firms pay to households includes rent, wages, interest, and profits. It equals the dollar value of the output sold as shown in the circular flow diagram in Figure 2-1.1. The flow on the diagram that includes expenditures for goods and services produced and sold in the product market represents gross domestic product (GDP). The approach to measuring GDP using this flow is called the *expenditures approach*.

**Student Alert:** Using the expenditures approach,

$$\text{GDP} = C + I + G + X_n$$

The details about this equation for GDP are developed in a later activity. For now, make sure you understand how the expenditures approach measures GDP, and that this equation forms the basis for models developed throughout the rest of the course.

The flow on the diagram that includes payments for the resources used to produce goods and services in the factor market is another way to represent GDP. The approach to measuring GDP using this flow is called the *income approach*.

In addition to the basic flow of economic activity illustrated by the flows between the product and factor markets shown on the outside of the diagram, there are leakages from the flow and injections into the flow that affect its size. The leakages and injections happen through the government, financial institutions (e.g., banks), and international trade. These are shown using the boxes in the center of the circular flow diagram.

Macroeconomic Theory Volker Böhm, 2017-10-30 This textbook offers a unique approach to macroeconomic theory built on microeconomic foundations of monetary macroeconomics within a unified framework of an intertemporal general equilibrium model extended to a sequential and dynamic analysis It investigates the implications of expectations and of stationary fiscal policies on allocations on the quantity of money and on the dynamic evolution of the economy with and without noise The text contrasts and compares the two main competing approaches in macroeconomics within the same intertemporal model of a closed monetary economy the one postulating full price flexibility to guarantee equilibrium in all markets at all times under perfect foresight or rational expectations versus the so called disequilibrium approach where trading occurs at non market clearing prices and wages when these adjust sluggishly from period to period in response to market disequilibrium signals
