The three controllers achieve closed-loop  $H_2$  norms of 1.04, 0.07 and 0.03, respectively. Construct closed-loop models and compare the gains from road disturbance to  $y_1, y_2, y_3$  for the passive and active systems. Show that all three controllers reduce suspension deflection and body acceleration below the set points.

So far you have designed  $H_{\infty}$  controllers that meet the performance objectives for the nominal plant discussed earlier. This model is only an approximation of the true actuator and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you will synthesize design  $\mu$  controllers that achieve robust performance for the entire family of plant models synthesized with the design function using the structured singular value  $\mu$ , i.e.,  $\mu$  or “structured” performance ( $\mu$  vs  $H_{\infty}$ ).
