**Data Analytics using Python** Mahmoud Ahmad Al-Khasawneh, 2024-08-07 Descriptive statistics are used to identify the fundamental characteristics of data in a research study Simply summarized information about the sample and measurements is provided Descriptive statistics provide information about the components and dissemination of values in single or multiple data set concisely The classical illustrative statistics allow experts to get a quick sense of the central inclination and degree of diffusion of values in a dataset with a single glance They are useful in gaining an understanding of

data distribution as well as in comparing different data distributions It is frequently necessary for human geographers to take into consideration the locational citations of the data they are working with Using spatial descriptive statistics analysts can determine the central propensity and variation of data in a given geographic area or region The two types of illustrative analysis are mutually supportive of one another Experts can research the geographic phenomena with which they are involved by combining both statistics and mathematics Even though descriptive statistics are straightforward concepts in statistical assessment they are essential and beneficial in today s world of massive amounts of data The performance and efficacy of descriptive analysis should not be overshadowed in the face of ever increasing huge quantities of data being generated continuously and distributed via the Internet Descriptive statistics are characterized by inferential analysis in most cases When you use descriptive statistics you are merely explaining what is or what the information reveals about something When using inferential analysis you are attempting to draw conclusions that are not based solely on the available data For example we use inferential analysis to try to infer what the general public might think based on a sample of data Alternatively we use inferential analysis to make decisions about the likelihood that a difference between groups observed in this study is a dependable difference or one that could have occurred by chance As a result we use inferential analysis to conclude more general conditions from our data whereas we use descriptive analysis to simply describe what is happening in our data Descriptive statistics are used to present quantitative explanations in a manageable format In a research study we may have a large number of measures Alternatively we can quantify a huge number of participants using any measure
