### Abstract.

A quadratic function is a function whose rule may be written in the form  $f(x) = ax^2 + bx + c$  where  $a$ ,  $b$ , and  $c$  are real numbers and  $a$  is not zero. The graph of a quadratic function is a parabola which opens up if  $a > 0$  and opens down if  $a < 0$ . Nonetheless, there are many key features in a quadratic graph such as the zeroes (x-intercepts, also known as the roots), y-intercept, axis of symmetry, and the vertex. We will be taking a look at these four features in this presentation. The zeroes, also known as the roots, are the x-intercepts of the parabola. A parabola with its vertex at  $(h, k)$ , opening vertically, will have the following properties. The axis of symmetry will have the equation  $x = h$ . Its form will be  $y = a(x - h)^2 + k$ . In either case, the vertex is a turning point on the graph. The graph is also symmetric with a vertical line drawn through the vertex, called the axis of symmetry. The y-intercept is the point at which the parabola crosses the y-axis. The x-intercepts are the points at which the parabola crosses the x-axis.
