IUTAM Symposium on Variational Concepts with Applications to the Mechanics of Materials Klaus

Hackl, 2010-06-02 Variational calculus has been the basis of a variety of powerful methods in the field of mechanics of materials for a long time. Examples range from numerical schemes like the finite element method to the determination of effective material properties via homogenization and multiscale approaches. In recent years, however, a broad range of novel applications of variational concepts has been developed. This comprises the modeling of the evolution of internal variables in inelastic materials as well as the initiation and development of material patterns and microstructures. The IUTAM Symposium on Variational Concepts with Applications to the Mechanics of Materials took place at the Ruhr University of Bochum, Germany, on September 22-26, 2008. The symposium was attended by 55 delegates from 10 countries. Altogether 31 lectures were presented. The objective of the symposium was to give an overview of the new developments sketched above, to bring together leading experts in these fields and to provide a forum for discussing recent advances and identifying open problems to work on in the future. The symposium focused on the development of new material models as well as the advancement of the corresponding computational techniques. Specific emphasis is put on the treatment of materials possessing an inherent microstructure and thus exhibiting a behavior which fundamentally involves multiple scales. Among the topics addressed at the symposium were: 1. Energy based modeling of material microstructures via envelopes of non-convex potentials and applications to plastic behavior and phase transformations.

Applications and Non-Metals D.M.R. Taplin, 2013-10-22 *Advances in Research on the Strength and Fracture of Materials* Volume 3B: *Applications and Non-Metals* contains the proceedings of the Fourth International Conference on Fracture held at the University of Waterloo, Canada, in June 1977. The papers review the state of the art with respect to testing of fracture in a wide range of non-metals such as ceramics, glass, composites, polymers, biomaterials and concrete. This volume is divided into five sections and opens by discussing the role of acoustic emission in fracture toughness testing and the relation between static and dynamic fracture toughness of structural steels. The reader is then introduced to methods for determining stress intensity factors of simplified geometries of structural parts, stress analysis of pressure vessels by thermal shock, the fracture toughness of constructional steels in cyclic loading and fracture processes and fracture toughness in powder forged steels. The remaining chapters explore the influence of low cycle damage on fracture toughness of structural alloys.
