Darwin's Roadmap to the Curriculum Glenn Geher, David Sloan Wilson, Hadassah Head, Andrew Gallup, 2019-05-01 There is a paradox when it comes to Darwinian ideas within the academy On one hand Darwin's theories have famously changed the foundational ideas related to the origins of life shaping entire disciplines in the biological sciences On the other hand people in educated societies across the globe today are famously misinformed and uneducated about Darwinian principles and ideas Applications of evolutionary theory outside the traditional areas of biology have been slow to progress and scholars doing such work regularly run into all kinds of political backlash However a slow but steady push to advance the teaching of evolution across academic disciplines has been under way for more than a decade This book serves to integrate the vast literature in the interdisciplinary field of Evolutionary Studies EvoS providing clear examples of how evolutionary concepts relate to all facets of life Further this book provides chapters dedicated to the processes associated with an EvoS education including examples of how an interdisciplinary approach to evolutionary theory has been implemented successfully at various colleges universities and degree programs This book also offers chapters outlining a variety of applications to an evolution education including improved sustainable development medical practices and creative and critical thinking skills Exploring controversies surrounding evolution education this volume provides a roadmap to asking and answering Darwinian questions across all areas of intellectual inquiry

Approaches to Plant Evolutionary Ecology Gregory Paul Cheplick, 2015 Plant evolutionary ecology is a rapidly growing discipline which emphasizes that populations adapt and evolve not in isolation but in relation to other species and abiotic environmental features such as climate Although it departs from traditional evolutionary and ecological fields of study the field is connected to branches of ecology genetics botany conservation and to a number of other fields of applied science primarily through shared concepts and techniques However most books regarding evolutionary ecology focus on animals creating a substantial need for scholarly literature with an emphasis on plants *Approaches to Plant Evolutionary Ecology* is the first book to specifically explore the evolutionary characteristics of plants filling the aforementioned gap in the literature on evolutionary ecology Renowned plant ecologist Gregory P Cheplick summarizes and synthesizes much of the primary literature regarding evolutionary ecology providing a historical context for the study of plant populations from an evolutionary perspective The book also provides summaries of both traditional common gardens reciprocal transplants and modern molecular genetic approaches used to address questions

about plant adaptation to a diverse group of abiotic and biotic factors Cheplick provides a rigorously written introduction to the rapidly growing field of plant evolutionary ecology that will appeal to undergraduate and graduate students with an interest in ecology and evolution as well as educators who are teaching courses on related topics *Biodiversity* Edmundas Lekevičius, 2022-09-20 Species are not functionally independent From a long term perspective only ecosystem with a fully integrated nutrient cycle is alive The lack of trophic autonomy should be considered one of the key factors that ensure and maintain biodiversity The variability of abiotic conditions both in space and in time also creates a huge diversity of niches and subniches for genotypes and species In addition life maintains its essential variables biomass and productivity as stable as possible due to the diversity of structures genes macromolecules metabolic pathways genotypes species etc the structures that reach optima are multiplied and thus activated while the functioning of those which lost their optima is suppressed The facts and concepts presented in this monograph thus support the conclusions that a genotype and species diversity is supported by trophic specialisation b biodiversity helps to stabilise the functions essential variables of individuals populations and ecological communities c in evolution the emergence of biodiversity is determined by heritable variation and the advantage of specialised more effective structures over non specialised ones d biodiversity is characterised by its ability to increase itself and to organise itself into relatively consistent structures which we call production pyramids and nutrient cycles This book therefore provides an answer to the question why the diversity of life is of such and such a nature
