

Thus, the oxidation number of sodium in the compound is $1+$ because one electron was transferred from the sodium atom. Because an electron is transferred to the chlorine atom, its oxidation number is $1-$.

- 7- In the chemical formula for any ionic compound, the symbol of the cation is always written first, followed by the symbol of the anion.
- 8- Subscripts, which are small numbers to the lower right of a symbol, represent the number of ions of each element in an ionic compound. If no subscript is written, it is assumed to be one.

Formulas for polyatomic ionic compounds:

- 9- polyatomic ions are ions made up of more than one atom. A polyatomic ion acts as an individual ion. Thus, the formula for a polyatomic compound follows the same rules used for a binary compound. Because a polyatomic ion exists as a unit, never change subscripts of the atoms within the ion.
