**Quad Rotorcraft**

**Control** Luis Rodolfo García Carrillo,Alejandro Enrique Dzul López,Rogelio Lozano,Claude Pégard,2012-08-12 Quad Rotorcraft Control develops original control methods for the navigation and hovering flight of an autonomous mini quad rotor robotic helicopter These methods use an imaging system and a combination of inertial and altitude sensors to localize and guide the movement of the unmanned aerial vehicle relative to its immediate environment The history classification and applications of UAVs are introduced followed by a description of modelling techniques for quad rotors and the experimental platform itself A control strategy for the improvement of attitude stabilization in quad rotors is then proposed and tested in real time experiments The strategy based on the use low cost components and with experimentally established robustness avoids drift in the UAV s angular position by the addition of an internal control loop to each electronic speed controller ensuring that during hovering flight all four motors turn at almost the same speed The quad rotor s Euler angles being very close to the origin other sensors like GPS or image sensing equipment can be incorporated to perform autonomous positioning or trajectory tracking tasks Two vision based strategies each designed to deal with a specific kind of mission are introduced and separately tested The first stabilizes the quad rotor over a landing pad on the ground it extracts the 3 dimensional position using homography estimation and derives translational velocity by optical flow calculation The second combines colour extraction and line detection algorithms to control the quad rotor s 3 dimensional position and achieves forward velocity regulation during a road following task In order to estimate the translational dynamical characteristics of the quad rotor relative position and translational velocity as they evolve within a building or other unstructured GPS deprived environment imaging inertial and altitude sensors are combined in a state observer The text give the reader a current view of the problems encountered in UAV control specifically those relating to quad rotor flying machines and it will interest researchers and graduate students working in that field The vision based control strategies presented help the reader to a better understanding of how an imaging system can be used to obtain the information required for performance of the hovering and navigation tasks ubiquitous in rotored UAV operation
