

Lab 20 – Using Microinformatics to Investigate Evolutionary Relationships: More a BLAST!

Introduction:

Genome-wide (GW) genomic studies using international consortia such as the Human Genome Project, now also include and require 20-fold – 24,000-fold the entire genome for each organism being sequenced. This project also systematically sequenced the genomes of other species, including the fruit fly, mouse and *Drosophila*, etc. The sequencer and computer programs of the personal computers of these systems are available for desktop and laptop use to address and test hypotheses.

Why is this information important? Being able to identify the precise location and sequence of human genes and other genes from independent genetic resources. In addition, finding other relationships of genes in other species helps in understanding evolutionary relationships among organisms. Many of our genes are identical or similar to those found in other species.

However, you already realize that it is impossible for a computer, because it has no "brain" or "mind" to understand information. Does it make a difference? It should take you time to learn how to use the computer to find human genes to try to find the same sequence of bases as that in your DNA. This laboratory will provide you with the technology needed to do this.

Microinformatics is a field that combines statistics, mathematical modeling, and computer-assisted analysis of biological data. Using microinformatics methods, entire genomes can be quickly compared to find the same genetic sequences and differences. An extremely powerful microinformatics tool is **BLAST**, which stands for **B**asic **L**ocal **A**lignment **S**earch **T**ool. Using **BLAST**, you can input a gene sequence or protein sequence and search for genes that identify it. Similar sequences or a similar structure.

In this investigation, you will use **BLAST** to compare relationships and phylogenetic information as measured in **alignments**, or **comparisons** (also called **alignments**) of DNA or protein sequences. **Figure 1** below depicts a typical alignment.

Note that the alignment is identical with the sequences and reads from the sequencing of specific species. The other two sequences are found to have some differences. They differ from the original.

Figure 1. A simple phylogenetic tree of the five species shown.
