

## DNA Replication

Read the article DNA Polymerase – Keeping you cloned then annotate the diagram below showing the process of DNA replication.

Complete the following using the most appropriate words:

DNA replication involves the separation of the two \_\_\_\_\_ chains that make up the molecule. Firstly the double helix is opened up by an enzyme called \_\_\_\_\_. The points where the helix splits are called \_\_\_\_\_. To allow the helix to untwist without causing a tangled mess, one chain is broken by an enzyme called \_\_\_\_\_. One new strand of DNA is made by the enzyme known as \_\_\_\_\_ in a continuous process. On the other strand the enzyme works in the opposite direction making small sections of \_\_\_\_\_ DNA simultaneously. The sections are then joined together by the enzyme \_\_\_\_\_. Any incorrect paired bases are removed using the enzyme \_\_\_\_\_. As the new DNA contains half of the original DNA, the process is known as \_\_\_\_\_ replication.

It takes place during the S phase of the cell cycle before cell division. The process begins at specific locations called origins of replication where the DNA double helix is unwound by the enzyme helicase, creating two single strands. Each strand serves as a template for the formation of a new complementary strand, facilitated by the enzyme DNA polymerase. The result is two identical DNA molecules, each containing one original and one newly synthesized strand, ensuring genetic consistency in daughter cells. DNA replication is crucial for growth, development, and tissue repair in multicellular organisms and for reproduction in single-celled organisms.

This book presents the complex subject of DNA replication in the most comprehensible and easy-to-understand language. The topics covered in this extensive book deal with the core topic of replication of DNA. For all those who are interested in molecular and cellular biology, this book can prove to be an essential guide.

**Did You Know?** DNA is the blueprint of life, carrying all the instructions for building and maintaining every living organism. If you stretched out all the DNA in a single cell, it would be about 2 meters long. DNA replication is not only responsible for genetic inheritance but also plays a vital role in evolution, aging, and health. Without DNA replication, life as we know it would not exist. Every time a cell divides, about 6 billion base pairs need to be copied with amazing accuracy. Mistakes do happen, but DNA has built-in proofreading mechanisms to correct them.
