

Manual Synchronization Mode

Dead Bus Close

1. For manual synchronization, the PCS must be in the MANUAL position. The following sequence of operations assumes the switch is in this position. Changing the switch position will interrupt the manual mode of operation and prevent the circuit breaker from being manually closed.
2. To initiate a manual dead bus closure, the ECS is placed in the RUN position.
3. As the generator set reaches approximately 50% speed and voltage, the Voltage Frequency Relay (VFR) will energize. This will energize the VBR.
4. With the VBR relay energized, the operator presses the circuit breaker close pushbutton (CBCPB), activating the CBPR.
5. A CBPR contact will energize the CBCR.
6. A CBCR contact will energize the circuit breaker close coil, closing the circuit breaker.

Live Bus Close

1. For manual synchronization, the PCS must be in the MANUAL position. The following sequence of operations assumes the switch is in this position. Changing the switch position will interrupt the manual mode of operation and prevent the circuit breaker from being manually closed.
2. To initiate a manual dead bus closure, the ECS is placed in the RUN position.
3. When a source is present on the load bus, the dead bus relay is energized, indicating the bus is live. The bus transformer fuse (BTB+) also detects voltage present on the bus.
4. The GSC+P checks if there are phase sequence alarms, inappropriate voltage alarms, or any other alarm present.
 - a. Yes – The GSC+P will issue the appropriate alarm. Breaker closure is prevented until the fault is corrected.
 - b. No – The GSC+P will verify conditions for synchronization.
5. Using the GSC+P synchroscope, the generator set frequency is manually adjusted to bring the generator set voltage in phase with the bus voltage. Refer to the SYNCHROSCOPE section for more details.

6. When the output frequency is in phase with the bus frequency and within the phase tolerance limit (P505), the GSC+P will issue a breaker close command.
7. To close the circuit breaker, the operator presses the circuit breaker close pushbutton (CBCPB). 7. With the GSC+P issuing a breaker close command and the CBCPB pressed, the CBPR is activated. A CBPR contact will energize the CBCR.
8. A CBCR contact will energize the circuit breaker close coil, closing the circuit breaker.

DiBella,2015-07-01 The senior research compliance administrator has emerged as a critically important position as
universities and other research organizations face an increasingly intricate regulatory environment These administrators are
tasked with a special challenge ensuring that their institutions conduct safe ethical and compliant research while also
helping researchers understand and meet compliance requirements and achieve their research goals These competing
responsibilities can make the role of the research administrator complex however those who serve in this role may find that
they have limited preparation for the challenges and little or no formal education in the field Thus the goal of this handbook
is to provide practical guidance to research administrators who are responsible for a wide variety of compliance programs
Previous volumes on these topics have focused primarily on educating research faculty staff and students An assumption in
many of these handbooks is that all additional questions related to research ethics and regulations should be directed to the
senior research administrator yet the books have limited guidance intended for the senior research administrators
themselves This handbook is designed therefore to serve as a detailed program implementation manual for these
administrators who are expected to be conversant on a broad range of complex ethical and regulatory topics and to provide
guidance to those conducting research as well as upper administration and others interested in safe ethical and compliant
