**MicroRNA Targeted Cancer Therapy** Fazlul H. Sarkar, 2014-04-22 Since the discovery of microRNAs miRNAs some twenty years ago by Victor Ambros David Baulcombe and Gary Ruvkun these three scientists worked to uncover the mystery of miRNA the small segments of nucleotides that silence genes While studying the development of the nematode worm Ambros and Ruvkun

discovered miRNA in animals while Baulcombe discovered it in plants Since their discovery it took more than two decade to fully appreciate the value of miRNA in human health and diseases Emerging evidence suggest that the activation of oncogenes and or the inactivation of tumor suppressor genes contribute to the development and progression of tumors The regulation of genes is by far controlled by many transcription factors which are often deregulated during the development and progression of cancer In addition emerging evidence clearly suggests that the deregulation of miRNAs or small non coding RNAs could also regulate the expression of genes and likewise miRNA genes are also regulated by transcription factors The most attractive feature of miRNAs is that one miRNA can regulate many target genes mRNAs and thus miRNA targeted therapy is highly promising because multiple genes could be regulated by targeting a single miRNA which becomes very important for the killing of highly heterogeneous populations of cancer cells within a tumor mass Therefore miRNA targeted therapy is an attractive attribute of miRNA research which is covered through eighteen chapters complied in this book *MicroRNA targeted Cancer therapy* and it is hoped that the field of miRNA research will be appreciated through critical reading of these chapters on the cutting edge research on miRNAs *Tumor Microenvironment and Metabolic*

*Reprogramming in Cancer* Wei Chong,Hao Chen,Houjuan Zhu,Asif Raza,Yiju Wei,2024-10-18 Metabolic reprogramming is the hallmark of malignant tumors Both metabolic phenotype and metabolic dependence are changed during the development of cancer from precancerous tissue to local invasion to metastasis Cancer cells autonomously alter their flux through various metabolic pathways in order to meet the increased bioenergetic and biosynthetic demand as well as mitigate oxidative stress required for cancer cell proliferation and survival The change of the tumor microenvironment TME is a key factor driving tumor metabolic reprogramming The tumor microenvironment denotes the non cancerous cells and components presented in the tumor including molecules produced and released by them The constant interactions between tumor cells and the tumor microenvironment play decisive roles in tumor initiation progression metastasis and response to therapies More and more evidence has pointed out that the change in the tumor microenvironment is a key factor driving tumor metabolic reprogramming However the specific relationship between tumor metabolic reprogramming and tumor microenvironment remains unclear Indeed emerging evidence indicates that cancer cells are able to suppress the anti tumor immune response by competing for and depleting essential nutrients or otherwise reducing the metabolic fitness of tumor infiltrating immune cells The actual process of how metabolic reprogramming and cancer immune response affect each other has not been understood *Fatty Acids* ,2023-05-31 Fatty Acids From Biosynthesis to Human Health discusses how fatty acids are associated with various diseases and health conditions such as cardiovascular disease cancer inflammation autoimmune diseases and metabolic disorders Nutrition fatty acid and therapeutic recommendations are provided for individuals with certain diseases and health conditions and for those interested in decreasing the risk factors for chronic diseases This book also covers biosynthesis and processing of fatty acids which address human health and environmental concerns

## **Emerging Anti-cancer Compounds and Immunomodulators for Pancreatic Cancer Treatment** Stephen

Safe, Jennifer M. Bailey-Lundberg, Kathleen E. DelGiorno, 2024-04-29 Pancreatic cancer is a highly lethal gastrointestinal disease that is becoming one of the leading causes of cancer mortality worldwide. Despite advances in surgery, radiation therapy, immunology, and therapeutics, the 5-year survival rate for pancreatic cancer patients remains around 12%. The poor prognosis is mainly due to late diagnosis as pancreatic cancer patients commonly do not exhibit symptoms until an advanced stage that is beyond surgical resection. Currently, the main treatments for patients with advanced pancreatic cancer are chemotherapy, radiotherapy, and most recent clinical trials incorporate immunotherapy.

**Repurposed Drugs Targeting Cancer Signaling Pathways: Clinical Insights to Improve Oncologic Therapies, volume II** Gerardo Leyva-Gómez, Teresita Padilla-Benavides, Alma D. Campos-Parra, 2025-06-12 The field of drug development is a time-consuming and costly process with the development of individual pharmaceutical products estimated to take between 11 and 14 years and cost between 161.1 to 800 million dollars. This has led to the rise of drug repositioning, where existing drugs are tested against diseases unrelated to their initial use as a prominent area in pharmacology. This approach is particularly relevant in the fight against cancer, a multifactorial disease where single molecular mechanisms, pathways, or biomarkers are often associated with a wide range of tumor types. The use of well-characterized non-cancer drugs as potential anticancer agents has increased, often in combination with existing chemotherapeutics or other repurposed agents. However, there is a need for further research to advance these interventional approaches and introduce them into clinical practice to improve treatments for cancer patients. The goal of this research topic is to explore the effects of repurposed drugs or drug repurposing candidates on cancer signaling pathways. This includes both in vitro and in vivo studies as well as computational approaches. The research aims to

provide information about the antitumor effectiveness of a diverse range of non cancer compounds through preclinical experiments clinical trials and observational studies The aim is to improve oncologic therapies by providing clinical insights into repurposed drugs targeting cancer signaling pathways The scope of this research topic is limited to studies that provide information about the effects of repurposed drugs or drug repurposing candidates on cancer signaling pathways We welcome articles addressing but not limited to the following themes The use of bioinformatics platforms to analyze the effect of potentially repositioned drugs The application of cutting edge molecular technologies such as liposomes and CRISPR Cas9 in the study of repurposed drugs Preclinical experiments that test the antitumor effectiveness of non cancer compounds Clinical trials and observational studies that provide insights into the use of repurposed drugs in oncologic therapies Please note that manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not accompanied by validation independent cohort or biological validation in vitro or in vivo are out of scope for this section and will not be accepted as part of this Research Topic
