### *Publisher/Date:*

- AGS Publishing, 4201 Woodland Road, Circle Pines, MN 55014-1796. Published, 2004.

### *Purpose:*

- Brief, individually-administered, norm-referenced test of intelligence and general aptitude, for individuals ages 4-90. It can be used for a variety of screening purposes and assessing cognitive functioning when it is a secondary consideration.

### *Provides:*

- An IQ composite score (KBIT-2 IQ Composite), comprised of tasks assessing verbal ability and nonverbal problem solving. The Verbal score is comprised of two tasks; one which assess receptive vocabulary/general knowledge (Verbal Knowledge) and the other assessing comprehension, reasoning, and vocabulary knowledge (Riddles). The Matrices subtest is the sole Nonverbal marker and assesses nonverbal conceptual reasoning and problem solving.

### *Standardization Issues:*

- 2,120 individuals from 34 states and the District of Columbia, ages 4-90 years, who speak English and did not present with impairments that may affect cognitive processing. The normative sample attempted to match 2001 US Census Bureau statistics for educational status (adults), mothers' educational level, race and ethnicity. Geographic breakdown in the normative sample overrepresented the Southern region (44.2% vs. 36%) and underrepresented the Northeastern region (11.4% vs. 19.8%). 23 normative age-groups are included and they varied in size, with the largest at ages 5 through 10 (n=125) and the smallest at ages 16, 17, and 18 (n=75). Two separate item-bias studies were conducted and did result in elimination of several items.

### *Reliability and Validity Issues:*

- Composite internal consistency reliabilities were quite good (.89 to .96) with reliabilities increasing with age. Verbal and Nonverbal internal coefficients were lower but still acceptable (Nonverbal internal coefficient at ages 4 & 5 was only .78, however). The Composite's test-retest reliability was .90 (over mean intervals between 22.5 to 30.8 days, and resulting in performance increases of about 4-points). Test-retest reliability for the Nonverbal scale at ages 4-12 years was only .73 (marginal). Validity studies yielded moderate-to-high correlations in terms of
