Mathematical Problems in Meteorological Modelling András Bátkai, Petra Csomós, István Faragó, András

Horányi, Gabriella Szépszó, 2016-11-08 This book deals with mathematical problems arising in the context of meteorological modelling. It gathers and presents some of the most interesting and important issues from the interaction of mathematics and meteorology. It is unique in that it features contributions on topics like data assimilation, ensemble prediction, numerical methods and transport modelling from both mathematical and meteorological perspectives. The derivation and solution of all kinds of numerical prediction models require the application of results from various mathematical fields. The present volume is divided into three parts moving from mathematical and numerical problems through air quality modelling to advanced applications in data assimilation and probabilistic forecasting. The book arose from the workshop Mathematical Problems in Meteorological Modelling held in Budapest in May 2014 and organized by the ECMI Special Interest Group on Numerical Weather Prediction. Its main objective is to highlight the beauty of the development fields discussed to demonstrate their mathematical complexity and more importantly to encourage mathematicians to contribute to the further success of such practical applications as weather forecasting and climate change projections. Written by leading experts in the field, the book provides an attractive and diverse introduction to areas in which mathematicians and modellers from the meteorological community can cooperate and help each other solve the problems that operational weather centres face now and in the near future. Readers engaged in meteorological research will become more familiar with the corresponding mathematical background while mathematicians working in numerical analysis, partial differential equations or stochastic analysis will be introduced to further application fields of their research area and will find stimulation and motivation for their future research work.

Demidenko, Evgeniy Romenski, Eleuterio Toro, Michael Dumbser, 2020-04-03 This book is a *liber amicorum* to Professor Sergei Konstantinovich Godunov and gathers contributions by renowned scientists in honor of his 90th birthday. The contributions address those fields that Professor Godunov is most famous for: differential and difference equations, partial differential equations, equations of mathematical physics, mathematical modeling, difference schemes, advanced computational methods for hyperbolic equations, computational methods for linear algebra and mathematical problems in continuum mechanics.

Hydrodynamics Harry Schulz, André Simoes, Raquel Lobosco, 2011-10-26 The constant evolution of the calculation capacity of modern computers implies a permanent effort to adjust existing numerical codes or to create new codes following new points of view aiming to adequately simulate fluid flows and the related transport of physical properties. Additionally, the continuous improving of laboratory devices and equipment which allow to record and measure fluid flows with a higher degree of details induces to elaborate specific experiments in order to shed light on unsolved aspects.

of the phenomena related to these flows This volume presents conclusions about different aspects of calculated and observed flows discussing the tools used in the analyses It contains eighteen chapters organized in four sections 1 Smoothed Spheres 2 Models and Codes in Fluid Dynamics 3 Complex Hydraulic Engineering Applications 4 Hydrodynamics and Heat Mass Transfer The chapters present results directed to the optimization of the methods and tools of Hydrodynamics

Computational Fluid and Solid Mechanics K.J. Bathe, 2001-05-21 The MIT mission to bring together Industry and Academia and to nurture the next generation in computational mechanics is of great importance to reach the new level of mathematical modeling and numerical solution and to provide an exciting research environment for the next generation in computational mechanics Mathematical modeling and numerical solution is today firmly established in science and engineering Research conducted in almost all branches of scientific investigations and the design of systems in practically all disciplines of engineering can not be pursued effectively without frequently intensive analysis based on numerical computations The world we live in has been classified by the human mind for descriptive and analysis purposes to consist of fluids and solids continua and molecules and the analyses of fluids and solids at the continuum and molecular scales have traditionally been pursued separately Fundamentally however there are only molecules and particles for any material that interact on the microscopic and macroscopic scales Therefore to unify the analysis of physical systems and to reach a deeper understanding of the behavior of nature in scientific investigations and of the behavior of designs in engineering endeavors a new level of analysis is necessary This new level of mathematical modeling and numerical solution does not merely involve the analysis of a single medium but must encompass the solution of multi physics problems involving fluids solids and their interactions involving multi scale phenomena from the molecular to the macroscopic scales and must include uncertainties in the given data and the solution results Nature does not distinguish between fluids and solids and does not ever repeat itself exactly This new level of analysis must also include in engineering the effective optimization of systems and the modeling and analysis of complete life spans of engineering products from design to fabrication to possibly multiple repairs to end of service Applied Mechanics Reviews, 1963 *High-Order Methods for Computational Physics* Timothy J. Barth, Herman Deconinck, 2013-03-09 The development of high order accurate numerical discretization techniques for irregular domains and meshes is often cited as one of the remaining challenges facing the field of computational fluid dynamics In structural mechanics the advantages of high order finite element approximation are widely recognized This is especially true when high order element approximation is combined with element refinement h p refinement In computational fluid dynamics high order discretization methods are infrequently used in the computation of compressible fluid flow The hyperbolic nature of the governing equations and the presence of solution discontinuities makes high order accuracy difficult to achieve Consequently second order accurate methods are still predominately used in industrial applications even though evidence suggests that high order methods may offer a way to significantly improve the resolution and accuracy for these calculations

To address this important topic a special course was jointly organized by the Applied Vehicle Technology Panel of NATO s Research and Technology Organization RTO the von Karman Institute for Fluid Dynamics and the Numerical Aerospace Simulation Division at the NASA Ames Research Cen ter The NATO RTO sponsored course entitled Higher Order Discretization Methods in Computational Fluid Dynamics was held September 14 18 1998 at the von Karman Institute for Fluid Dynamics in Belgium and September 21 25 1998 at the NASA Ames Research Center in the United States
