Russian Chemical Reviews, 1988 **Materials for Sustainable Energy** Vincent Dusastre, 2011 The search for cleaner cheaper smaller and more efficient energy technologies has to a large extent been motivated by the development of new materials The aim of this collection of articles is therefore to focus on what materials based solutions can offer and show how the rationale design and improvement of their physical and chemical properties can lead to energy production alternatives that have the potential to compete with existing technologies In terms of alternative means to generate electricity that utilize renewable energy sources the most dramatic breakthroughs for both mobile i e transportation and stationary applications are taking place in the fields of solar and fuel cells And from an energy storage perspective exciting developments can be seen emerging from the fields of rechargeable batteries and hydrogen storage *Applied Mechanics Reviews*, 1968 **A Review of Ceramic Thin Film Technology** Milo Macha, 1967 The report comprises a detailed description of the materials techniques and problems in each of the three major areas of thin film applications dielectrics magnetics and semiconductors Included in the report are also basic theories necessary for a complete understanding of the physical and chemical processes related to the areas of interest Theoretical analysis leads to a description of the critical physical chemical and structural requirements of films for device applications The state of the art of all aspects of ceramic thin film technology is critically reviewed and recommendations are suggested to overcome existing limitations *The Physics of Solar Energy Conversion* Juan Bisquert, 2020-06-09 Research on advanced energy conversion devices such as solar cells has intensified in the last two decades A broad landscape of candidate materials and devices were discovered and

systematically studied for effective solar energy conversion and utilization New concepts have emerged forming a rather powerful picture embracing the mechanisms and limitation to efficiencies of different types of devices The Physics of Solar Energy Conversion introduces the main physico chemical principles that govern the operation of energy devices for energy conversion and storage with a detailed view of the principles of solar energy conversion using advanced materials Key Features include Highlights recent rapid advances with the discovery of perovskite solar cells and their development Analyzes the properties of organic solar cells lithium ion batteries light emitting diodes and the semiconductor materials for hydrogen production by water splitting Embraces concepts from nanostructured and highly disordered materials to lead halide perovskite solar cells Takes a broad perspective and comprehensively addresses the fundamentals so that the reader can apply these and assess future developments and technologies in the field Introduces basic techniques and methods for understanding the materials and interfaces that compose operative energy devices such as solar cells and solar fuel converters
