In this thesis we study device independent quantum key distribution based on energy time entanglement This is a method for cryptography that promises not only perfect secrecy but also to be a practical method for quantum key distribution thanks to the reduced complexity when compared to other quantum key distribution protocols However there still exist a number of loopholes that must be understood and eliminated in order to rule out eavesdroppers We study several relevant loopholes and show how they can be used to break the security of energy time entangled systems Attack strategies are reviewed as well as their countermeasures and we show how full security can be re established Quantum key distribution is in part based on the profound no cloning theorem which prevents physical states to be copied at a microscopic level This important property of quantum mechanics can be seen as Nature s own copy protection and can also be used to create a currency based on quantummechanics i e quantum money Here the traditional copy protection mechanisms of traditional coins and banknotes can be abandoned in favor of the laws of quantum physics Previously quantum money assumes a traditional hierarchy where a central trusted bank controls the economy We show how quantum money together with a blockchain allows for Quantum Bitcoin a novel hybrid currency that promises fast transactions extensive scalability and full anonymity
