Selected papers from the 2nd International Symposium on UAVs, Reno, U.S.A. June 8-10, 2009 Kimon P. Valavanis,Randal Beard,Paul Oh,Aníbal Ollero,Leslie A. Piegl,Hayong Shin,2011-04-11 In the last decade significant changes have occurred in the field of vehicle motion planning and for UAVs in particular UAV motion planning is especially difficult due to several complexities not considered by earlier planning strategies the increased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and difficulty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is difficult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle field A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data

research is always a learning experience The variety of phenomena that the people who gathered in Lausanne reported and
discussed for the fifth time since 1991 at the European Conference on Artificial Life ECAL has not been programmed crafted

organisation or development Artificial Life is a field where biological and artificial sciences meet and blend together where
the dynamics of biological life are reproduced in the memory of computers where machines evolve behave and communicate
like living organisms where complex life like entities are synthesised from electronic chromosomes and artificial chemistries
The impact of Artificial Life in science philosophy and technology is tremendous Over the years the synthetic approach has
established itself as a powerful method for investigating several complex phenomena of life From a philosophical standpoint
the notion of life and of intelligence is continuously reformulated in relation to the dynamics of the system under observation
and to the embedding environment no longer a privilege of carbon based entities with brains and eyes At the same time the
possibility of engineering machines and software with life like properties such as evolvability self repair and self
maintenance is gradually becoming reality bringing new perspectives in engineering and applications
