Contact US! Trainer's Manual Jane Lockwood, Hayley McCarthy, 2010-06-21 CONTACT US develops high end professional English language communication skills for the BPO industry This manual contains a comprehensive introduction to the course outlining the teaching approach and describing the unit structure in detail It includes model answers to the activities and keys to exercises as well as photocopyable materials Multisensory and sensorimotor interactions in speech perception Kaisa Tiippana, Jean-Luc Schwartz, Riikka Möttönen, 2015-06-26 Speech is multisensory since it is perceived through several senses Audition is the most important one as speech is mostly heard The role of vision has long been acknowledged since many articulatory gestures can be seen on the talker's face Sometimes speech can even be felt by touching the face The best known multisensory illusion is the McGurk effect where incongruent visual articulation changes the auditory percept The interest in the McGurk effect arises from a major general question in multisensory research How is information from different senses combined Despite decades of research a conclusive explanation for the illusion remains elusive This is a good demonstration of the challenges in the study of multisensory integration Speech is special in many ways It is the main means of human communication and a manifestation of a unique language system It is a signal with which all humans have a lot of experience We are exposed to it from birth and learn it through development in face to face contact with others It is a signal that we can both perceive and produce The role of the motor system in speech perception has been debated for a long time Despite very active current research it is still unclear to which extent and in which role the motor system is involved in speech perception Recent evidence shows that brain areas involved in speech production are activated during listening to speech and watching a talker's articulatory gestures Speaking involves coordination of articulatory movements and monitoring their auditory and somatosensory consequences How do auditory visual somatosensory and motor brain areas interact during speech perception How do these sensorimotor interactions contribute to speech perception It is surprising that despite a vast amount of research the secrets of speech perception have not yet been solved The multisensory and sensorimotor approaches provide new opportunities in solving them Contributions to the research topic are encouraged for a wide spectrum of research on speech perception in multisensory and sensorimotor contexts including novel experimental findings ranging from psychophysics to brain imaging theories and models reviews and opinions

Multitasking: Executive Functioning in Dual-Task and Task Switching Situations Tilo Strobach, Mike Wendt, Markus Janczyk, 2018-03-27 Multitasking refers to performance of multiple tasks The most prominent types of multitasking are situations including either temporal overlap of the execution of multiple tasks i.e. dual tasking or executing multiple tasks in varying sequences i.e. task switching In the literature numerous attempts have aimed at theorizing about the specific characteristics of executive functions that control interference between simultaneously and/or sequentially active component of task sets in these situations However these approaches have been rather vague regarding explanatory concepts e.g. task

set inhibition preparation shielding capacity limitation widely lacking theories on detailed mechanisms and or empirical evidence for specific subcomponents The present research topic aims at providing a selection of contributions on the details of executive functioning in dual task and task switching situations The contributions specify these executive functions by focusing on 1 fractionating assumed mechanisms into constituent subcomponents 2 their variations by age or in clinical subpopulations and or 3 their plasticity as a response to practice and training *Human-Computer Interaction. Adaptive Interaction Stephen J. Payne, Andrew Howes, 2022-06-01 This lecture describes a theoretical framework for the behavioural sciences that holds high promise for theory driven research and design in Human Computer Interaction The framework is designed to tackle the adaptive ecological and bounded nature of human behaviour It is designed to help scientists and practitioners reason about why people choose to behave as they do and to explain which strategies people choose in response to utility ecology and cognitive information processing mechanisms A key idea is that people choose strategies so as to maximise utility given constraints The framework is illustrated with a number of examples including pointing multitasking skim reading online purchasing Signal Detection Theory and diagnosis and the influence of reputation on purchasing decisions Importantly these examples span from perceptual motor coordination through cognition to social interaction Finally the lecture discusses the challenging idea that people seek to find optimal strategies and also discusses the implications for behavioral investigation in HCI
