**Code Generation — Concepts, Tools, Techniques** Robert Giegerich, S.L. Graham, 2013-03-09 Code Generation Concepts Tools Techniques is based

upon the proceedings of the Dagstuhl workshop on code generation which took place from 20-24 May 1991. The aim of the workshop was to evaluate current methods of code generation and to indicate the main directions which future research is likely to take. It provided an excellent forum for the exchange of ideas and had the added advantage of bringing together European and American experts who were unlikely to meet at less specialised gatherings. This volume contains 14 of the 30 papers presented at the Dagstuhl workshop. The papers deal mainly with the following four topics: tools and techniques for code generation; code generation for parallel architectures; register allocation and phase ordering problems; and formal methods and validations. Most of the papers assess the progress of on-going research work, much of which is published here for the first time, while others provide a review of recently completed projects. The volume also contains summaries of two discussion groups which looked at code generation tools and parallel architectures. As a direct result of one of these discussions, a group of the participants have collaborated to make a pure BURS system available for public distribution. This system, named BURG, is currently being beta tested. *Code Generation: Concepts, Tools, Techniques* provides a representative summary of state-of-the-art code generation techniques and an important assessment of possible future innovations. It will be an invaluable reference work for researchers and practitioners in this important area.

**Code Generation in Action** Jack Herrington, 2003. Covering technique and implementation for building code for complex applications frameworks, this book demonstrates how to build high-quality output that is consistent and maintainable. Lessons on abstracting the design of the code so that multiple outputs can be created from a single abstract model of the application functionality are provided. Techniques that range from using simple code processors to handle common coding problems to creating more elaborate and complex generators that maintain entire application tiers are covered. Topics such as building database access, user interface, remote procedure test cases, and business logic code are also addressed, as is code for other system functions. Although code generation is an engineering technique, it also has an impact on engineering teams and management, an aspect of code generation that is covered in depth in this resource.

*A survey and critique of some models of code generation* Carnegie-Mellon University. Computer Science Dept., R. G. Cattell, 1977. Various work on code generation is discussed, particularly from the point of view of simplifying and/or automating the derivation of this phase of compilers. Code generators which typically translate an intermediate notation into target machine code in one or more steps have been relatively ad hoc as compared to the first phase of compilers which translates a source language into the intermediate notation. Progress in formalizing the code generation process is summarized with the conclusion that considerably more work remains. Future directions of research are suggested. Author

Generator software tools that translate a high level specification into executable programs have been instrumental in facilitating the development of distributed software systems. Developers write programs at a high level abstraction with high readability and reduced initial development cost. However, existing approaches to building code generation tools for such systems have difficulties evolving these tools to meet challenges of new standards, new platforms and languages or changing product scopes, resulting in generator tools with limited lifespan. The difficulties in evolving generator tools can be characterized as a combination of three challenges that appear inherently difficult to solve simultaneously: the abstraction mapping challenge (translating a high level abstraction into a low level implementation), the interoperable heterogeneity challenge (stemming from multiple input and output formats), and the flexible customization challenge (to extend base functionality for evolution or new applications). The Clearwater approach to code generation uses XML based technologies and software tools to resolve these three challenges with three important code generation features: specification extensibility (whereby an existing specification format can accommodate extensions or variations at low cost), generator pliability (which allows the generator to operate on an extensible specification and/or support multiple and new platforms), and flexible customization (which allows an application developer to make controlled changes to the output of a code generator to support application specific goals). The presentation will outline the Clearwater approach and apply it to meet the above three challenges in two domain areas. The first area is information flow applications, e.g., multimedia streaming and event processing, a horizontal domain in which the ISG code generator creates QoS customized communication code using the Infopipe abstraction and specification language. The second area is enterprise application staging, e.g., complex N tier distributed applications, a vertical domain in which the Mulini code generator creates multiple types of source code supporting automatic staging of distributed heterogeneous applications in a data center environment. The success of applying Clearwater to these domains shows the effectiveness of our approach.
