Recurrent Events Data Analysis for Product Repairs, Disease Recurrences, and Other Applications Wayne B. Nelson, 2003-01-01 Survival data consist of a single event for each population unit namely end of life which is modeled with a life distribution In contrast many applications involve repeated events data where a unit may accumulate any number of events over time Examples include the number and cost of repairs of products the number and treatment costs of recurrent disease episodes in patients and the number of childbirths to statisticians This applied book provides practitioners with basic nonparametric methods for such data particularly the plot of the estimate of the population mean cumulative function MCF which yields most of the information sought Recurrent Events Data Analysis for Product Repairs Disease Recurrences and Other Applications is the first book to present a simple unified theory that includes data on costs or other values of discrete events not just the number of events It surveys computer programs that calculate and plot the MCF estimate with confidence limits shows their output and explains how to interpret such plots Many such calculations can be easily done with a pocket calculator or spreadsheet program Also the book introduces basic Poisson and Cox regression models and parametric models including homogeneous and nonhomogeneous Poisson processes and renewal processes
