

Quality water is vital to your operation.

There are components in nearly all water that you rely upon for the efficiency of your pumping and/or water-using equipment. There is a natural mineral salt in it that passes through soil and limestone it picks up minerals. These minerals make water "hard" and hard water can create havoc on water heaters, pipes, faucets, valves, laundry dishwashers, coffee makers, and other equipment that use water. Calcium causes the scaling that water can contain and ingression.

Calcium and magnesium, when ingested from water or combined with food, can form hard, chalky deposits known as deposits. These deposits can clog pipes, reducing flow and heat transfer efficiency, requiring more energy to heat water. Low operation time efficiency and poor maintenance and energy costs rise.

The Ion Exchange Process

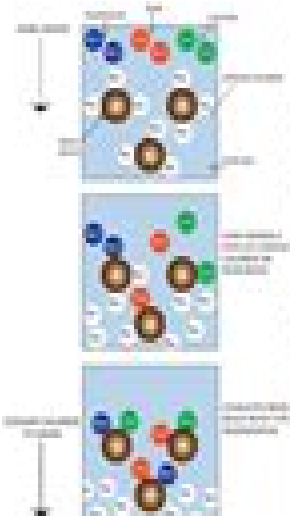

Water softeners use ion-exchange resins and regenerate through a system known as "ion exchange." Systems consist of two tanks: a resin tank and a brine tank. The resin tank contains a bed of negatively charged resin (small plastic beads) that are coated with sodium ions. Hardwater cations (Calcium and Magnesium) are attracted to sodium ions. Therefore, hard water passes through the tank.

During ion exchange, with sodium ions and are replaced by the resin, during the sodium ion release into the water flow the sodium in the water is replaced by calcium and magnesium, the "soft" water is now ready for use by your operation.

During the exchange process, the sodium ions actually replace those ions attached to the sodium ion regeneration to reverse the exchange capacity. High concentrations sodium chloride solution is drawn from the brine tank and passed through the resin tank. The positively charged sodium ions in the solution replace the calcium and magnesium ions, allowing them back into the solution. These functions are done before the tank is used.

Measuring Grains of Hardness

Hardness of water is measured in grains per gallon (GPG) or pounds in grains per gallon (PPG). One GPG equals 171 grains. High hardness water with GPG of 7 or more is considered hard. In certain industries applications the level of hardness can be too high (5 GPG) because the hardness of your water is too high using single and step or a double step and double can provide an analysis of your water to determine the correct water treatment solution for your operation.

Water	Grain/Gallon	mg/L or gpm
Soft	0.0	0.0
Typing Hard	1.0 to 3.0	171 - 513
Medium Hard	3.0 to 7.0	513 - 1197
Hard	7.0 to 10.0	1197 - 1699
Very Hard	10.0 +	1699 +

When a water softener has run its life, there's nothing you can do. Water softeners are water dependent meaning they will exchange sodium ions with calcium magnesium ions, replace the magnesium and calcium water. Water softeners are not like other water that harden water. Water softeners are for calcium ions, hardness, minerals and calcium that are after the softening tank and after it, your water is not affected by softening your water. For those who should consider a "Water-Safe" system, it is a Water-Safe system.
