

An axial load P is applied to a 150"-long continuous bar with the cross-sectional areas (A) shown in the figure below. The stress-strain relation of the material used to make this bar obtained during a tension test can be expressed as follows

$$\epsilon = \frac{\sigma}{16000} + \left(\frac{\sigma}{165}\right)^3$$

where σ is the normal stress in ksi.

- Determine the axial elongation (in inch) and strain (in %) of the bar when $P=5$ kips.
- Find the permanent elongation (in inch) and strain (in %) of the bar after removal of P in a).

Note: You can assume that the elastic modulus (E) of material of the bar is equal, at all times, to the slope of the stress-strain curve at the origin.
