Case Facts

Abraham presented general symptoms of a Major Depressive Disorder (MDD). Abe experienced extreme fatigue, sadness, worry, paranoia, guilt, restlessness, and lethargy, which predicts his condition to MDD. The client was specifically concerned about the abrupt changes in his feelings, emotions, and thoughts after the closure of his grocery. Abe depicted intrapersonal conflicts because he could not employ more workers or retain the initial staff who worked for him.

Predisposition

No family member had been linked to anxiety-related disorders by the time the client was admitted to the local medical facility. The family history of a mental disorder might only be linked to the trauma experienced by the members while at refugee camps. Moreover, neither did the client inherit medical factors nor genetic contributions from his lineage. Abe depicted acculturation disparity of stress because he believed in working with people from divergent cultures. The disengaged family environments and a few friends contributed to the social predisposition of Abrahams's mental instability. The psychological elements of predisposition link Abe to aggressiveness and suicidal thoughts that accumulate into his problems with MDD. The patient also depicted some form of shyness, social withdrawal, and conservatisms of information.

Precipitants

The onset of the problems associated with MDD began with observing particular social, physical, and psychological stressors in Abe's life. The economic turmoil of business closure and bankruptcy affected the client's mental stability. He feared rejection from society and some family members who entrusted him with the role of a breadwinner. The physical stressor of trauma reminded the client of the harsh environments they experienced in refugee camps; he imagined himself in similar

Raymond Lake,2012-03-21 Schizophrenia is the most widely known and feared mental illness worldwide yet a rapidly growing literature from a broad spectrum of basic and clinical disciplines especially epidemiology and molecular genetics suggests

that schizophrenia is the same condition as a psychotic bipolar disorder and does not exist as a separate disease The goal is to document and interpret these data to justify eliminating the diagnosis of schizophrenia from the nomenclature The author reviews the changing diagnostic concepts of schizophrenia and bipolar disorder with a historical perspective to clarify how the current conflict over explanations for psychosis has arisen That two disorders schizophrenia and bipolar known as the Kraepelinian dichotomy account for the functional psychoses has been a cornerstone of Psychiatry for over 100 years but is questioned because of substantial similarities and overlap between these two disorders Literature in the field demonstrates that psychotic patients are frequently misdiagnosed as suffering from the disease called schizophrenia when they suffer from a psychotic mood disorder Such patients their families and their caretakers suffer significant disadvantages from the misdiagnosis Psychotic patients misdiagnosed with schizophrenia receive substandard care regarding their medications thus allowing their bipolar conditions to worsen Other adverse effects are substantial and will be included Liability for medical malpractice is of critical importance for the mental health professionals who make the majority of the diagnoses of schizophrenia The concept put forward in this work will have a discipline altering impact Major Depressive Disorder
