Unit 1 – Weather and Climate

The Climate within the UK

There are FIVE main reasons for the changing/fluctuating temperature in the UK. You will need to memorise each of them by heart!

Pressure Systems (from the west)

- Low pressure from the west makes a lot of rainfall as the air is rising and the water vapour is condensing.
- The is opposite for high pressure

Altitude (how high the land is)

- The higher the altitude, the colder the temperature as the air is thinner.
- The higher the altitude, the wetter it is as the vapour condenses.

Prevailing Wind

- The UK's most common prevailing wind is from the south west.
- It brings moist, warm air, making the UK wet and warm.
- The West gets more heat and rain than the east.

Latitude (how far north or south of the equator something is, the further north you go, the colder it is)

- The sun is at a lower angle in the sky so its heat energy is spread over more of the earth's

Distance from the sea

- Areas nearer the sea are warmer in winter because the sea shores keep them warm.
- Areas near the sea are cooler in summer because the sea takes a long time to heat up.
- The West gets more warmed up than the East

Depressions

Okay, the depressing part of the GCSE is the "depressions".

- 1) They form in the Atlantic Ocean, then move east over the UK.
- 2) The warm air is less dense so it rises above the cold air
- 3) Condensation occurs as the warm air rises causing rain clouds to develop
- 4) Rising air also causes low pressure at the Earth's surface
- 5) So winds blow into the depression in a spiral (High to low pressure)
- 6) A warm front is the front edge of the moving warm air.
- 7) A cold front is the front edge of the moving cold air.
