Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

[Note: The purpose of these questions is to activate prior knowledge and get students thinking. Students are not expected to know the answers to the Prior Knowledge Questions.]

Have you ever heard a siren on a moving ambulance, fire truck, or police car? If so, what happens to the sound as the vehicle passes by?

Answers will vary. [The pitch of the sound gets lower as the vehicle passes by.]

The change in the sound that you hear is called the **Doppler shift**.

Gizmo Warm-up

The *Doppler Shift* Gizmo™ illustrates why the Doppler shift occurs. The Gizmo shows a vehicle that emits **sound waves** and an observer who will hear the sounds.

1. Click the **PLAY SAMPLE** button (⏮️) to check that the Gizmo's sound and your friend's speaker are working.

What do you hear?

The pitch of the sound goes from high to low.

2. Click **Play** (▶️) and observe the sound waves emitted from the moving car. Click **Pause** (⏸️) and compare the sound waves in front of and behind the car. What do you notice?

The sound waves are closer together in front of the car than behind the car.

3. Use the **Ruler** to measure the **wavelength**, or the distance between the lines, of the waves in front of and behind the car. (Note: The red circles represent every thousandth wave.)

Wavelength in front of car: ~500 m

Wavelength behind car: ~900 m

[Note: The above measurements assumes that the user has chosen the default settings for the Gizmo: $f_{source} = 500$ Hz, $v_{source} = 100$ m/s, $v_{sound} = 340$ m/s.]

4. Why do you think the waves in front of the car have a shorter wavelength than the waves behind the car?

The car is moving toward the waves in front of it and away from the waves behind it. As a result, the distance between the waves is shorter in front of the car and longer behind the car.
