

B. Replace one of the wire segments with another 1.5-volt battery. What happens?

The light bulb becomes brighter as a result of the increased power

4. **Compare:** Compare a series circuit powered by six 1.5-volt batteries to a series circuit powered by a single 9-volt battery. Make sure there are equal numbers of light bulbs in each circuit and that the batteries are all in the same orientation.

What do you notice?

Each battery in six is 1.5 volts. The voltage will be 9 if there are 6 batteries present, giving both light bulbs the same level of brightness. As they are both 9 volts, it will be the same as the 6 batteries.

Why is this true?

Due to the identical brightness provided by each circuit, it will be the same for both circuits.

Activity C: Parallel circuits

Get the Gizmo ready:

- Click **Clear**.
- Check that **Show current** is on.
- Build the circuit shown to the right.

Question: In a **parallel circuit**, there is more than one path that current can take. What are the characteristics of parallel circuits?

1. **Observe:** Turn the **switch** to **ON**, which allows charges to flow through the circuit. Notice how brightly each bulb is lit and how much charge is flowing in each part of the wire. Are the two bulbs equally bright?

Both of the light bulbs are equally lit

2. **Experiment:** Add two more light bulbs to the circuit, as shown to the right. Turn the **switch** to **ON**, and observe the brightness of the bulbs.

A. Did the brightness of the bulbs change?

No

B. Remove one light bulb. What happens?

Nothing the lights stay the same brightness

C. How did the parallel circuit respond differently to these changes than a series circuit?

Adding bulbs:

Parallel circuits will have identically glowing lights. But in series circuits, each bulb's brightness varies.

Removing bulbs:

In a parallel circuit, when a bulb is removed, the remaining bulbs continue to shine at the same brightness. In a series circuit, however, the brightness of each bulb increases.
