

Evolution and Selection

What mechanisms lead to changes in the diversity of species on Earth?

Why?

People make choices by selecting options they like best. The natural world also 'selects' (although not as a conscious decision) when environmental conditions allow organisms with a particular genetic trait to live healthier lives than other organisms. In this activity, we will explore how selection affects populations overtime.

Model 1 – Desktop Swab Results

1. What is the source of the bacteria in the culture tube in Model 1?

The bacteria in model 1 comes from the top of a desktop so it most likely came from human sources that have contact with the desk top.

2. How many genetic variants of *E. coli* were present in the culture from the initial swab?

There were four genetic variants of *E. coli* present in the initial swab.

3. What variants of *E. coli* are found on the dish grown without triclosan?

All four variants of *E. coli* are found on the dish grown without the triclosan.

4. Refer to the dish in Model 1 with the medium that included triclosan.

- a. What variants of *E. coli* are found on the dish grown with triclosan?

The only variant of *E. coli* found on the dish grown with triclosan is Variant S.

- b. What likely happened to the other variants of *E. coli* on the dish with the medium containing triclosan?

The other bacteria was likely killed by the triclosan.

Human Gene Mutation David Neil Cooper, Michael Krawczak, 1993 Within the last decade much progress has been made in the analysis and diagnosis of human inherited disease and in the characterization of the underlying genes and their associated pathological lesions

Understanding the Impact of Gene mutation on Health & Diseases. An Overview. Dr. HAKIM, 2020-04-09 Each cell depends on thousands of proteins to do their jobs in the right places at the right times to function correctly Sometimes gene mutations prevent one or more of these proteins from working properly By changing a gene's instructions for making a protein a mutation can cause the protein to malfunction or to be missing entirely When a mutation alters a protein that plays a critical role in the body it can disrupt normal development or cause a medical condition A condition caused by mutations in one or more genes is called a genetic disorder In some cases gene mutations are so severe that they prevent an embryo from surviving until birth These changes occur in genes that are essential for development and often disrupt the development of an embryo in its earliest stages Because these mutations have very serious effects they are incompatible with life It is important to note that genes themselves do not cause disease genetic disorders are caused by mutations that make a gene function improperly For example when people say that someone has the cystic fibrosis gene they are usually referring to a mutated version of the CFTR gene which causes the disease All people including those without cystic fibrosis have a version of the CFTR gene An attempt has been made in this informative Booklet to summarize the fundamental topics related to genetic mutations and its impact on health and development along with several illustrations Dr H K Saboowala M B Bom M R S H London

Mutations in Human Genetic Disease David Cooper, Jian-Min Chen, 2012-10-12 Different types of mutation can vary in size from structural variants to single base pair substitutions but what they all have in common is that their nature size and location are often determined either by specific characteristics of the local DNA sequence environment or by higher order features of the genomic architecture The genomes of higher organisms are now known to contain pervasive architectural flaws in that certain DNA sequences are inherently mutation prone by virtue of their base composition sequence repetitiveness and or epigenetic modification In this volume a number of different authors from diverse backgrounds describe how the nature location and frequency of different types of mutation causing inherited disease are shaped in large part and often in remarkably predictable ways by the local DNA sequence environment

describe how the nature location and frequency of different types of mutation causing inherited disease are shaped in large part and often in remarkably predictable ways by the local DNA sequence environment **Mobilizing Mutations** Daniel Navon,2019-09-20 With every passing year more and more people learn that they or their young or unborn child carries a genetic mutation But what does this mean for the way we understand a person Today genetic mutations are being used to diagnose novel conditions like the XY Fragile X NGLY1 mutation and 22q11.2 Deletion syndromes carving out rich new categories of human disease and difference Daniel Navon calls this form of categorization genomic designation and in *Mobilizing Mutations* he shows how mutations and the social factors that surround them are reshaping human classification Drawing on a wealth of fieldwork and historical material Navon presents a sociological account of the ways genetic mutations have been mobilized and transformed in the sixty years since it became possible to see abnormal human genomes providing a new vista onto the myriad ways contemporary genetic testing can transform people's lives Taking us inside these shifting worlds of research and advocacy over the last half century Navon reveals the ways in which knowledge about genetic mutations can redefine what it means to be ill different and ultimately human *Genetic Bypass* Amy Yasko,2005-01-01

Crumbling Genome Alexey S. Kondrashov,2017-07-12 A thought provoking exploration of deleterious mutations in the human genome and their effects on human health and wellbeing Despite all of the elaborate mechanisms that a cell employs to handle its DNA with the utmost care a newborn human carries about 100 new mutations originated in their parents about 10 of which are deleterious A mutation replacing just one of the more than three billion nucleotides in the human genome may lead to synthesis of a dysfunctional protein and this can be inconsistent with life or cause a tragic disease Several percent of even young people suffer from diseases that are caused exclusively or primarily by pre-existing and new mutations in their genomes including both a wide variety of genetically simple Mendelian diseases and diverse complex diseases such as birth anomalies diabetes and schizophrenia Milder but still substantial negative effects of mutations are even more pervasive As of now we possess no means of reducing the rate at which mutations appear spontaneously However the recent flood of genomic data made possible by next generation methods of DNA sequencing enabled scientists to explore the impacts of deleterious mutations on humans with previously unattainable precision and begin to develop approaches to managing them Written by a leading researcher in the field of evolutionary genetics *Crumbling Genome* reviews the current state of knowledge about deleterious mutations and their effects on humans for those in the biological sciences and medicine as well as for readers with only a general scientific literacy and an interest in human genetics Provides an extensive introduction to the fundamentals of evolutionary genetics with an emphasis on mutation and selection Discusses the effects of pre-existing and new mutations on human genotypes and phenotypes Provides a comprehensive review of the current state of knowledge in the field and considers crucial unsolved problems Explores key ethical scientific and social issues likely to become relevant in the near future as the modification of human germline genotypes becomes technically feasible *Crumbling*
