Salicone,2007-06-04 It is widely recognized by the scientific and technical community that measurements are the bridge between the empirical world and that of the abstract concepts and knowledge In fact measurements provide us the quantitative knowledge about things and phenomena It is also widely recognized that the measurement result is capable of providing only incomplete information about the actual value of the measurand that is the quantity being measured Therefore a measurement result comes useful in any practical situation only if a way is defined for estimating how incomplete is this information The more recent development of measurement science has identified in the uncertainty concept the most suitable way to quantify how incomplete is the information provided by a measurement result However the problem of how to represent a measurement result together with its uncertainty and propagate measurement uncertainty is still an open topic in the field of metrology despite many contributions that have been published in the literature over the years Many problems are in fact still unsolved starting from the identification of the best mathematical approach for representing incomplete knowledge Currently measurement uncertainty is treated in a purely probabilistic way because the Theory of Probability has been considered the only available mathematical theory capable of handling incomplete information However this approach has the main drawback of requiring full compensation of any systematic effect that affects the measurement process However especially in many practical applications the identification and compensation of all systematic effects is not always possible or cost effective Next Generation Science Standards NGSS Lead States,2013-09-15
