Topic 2 Electric cells as energy systems

Week 2

✓ Let's learn Terminology!

Cell: a device that produces electricity through chemical reactions.

Volt (V): the unit of measurement of the energy that a cell can produce.

✓ Let's Read!

Study through the prescribed material your teacher will refer you to!

✓ Let's sum it up!

We use **cells** to produce electric current. This is done when the **substances** in the cell **react** and **separate** positive and negative **charges** so that one terminal has an **excess of electrons** (negative terminal). The other terminal has a **shortage of electrons** (positive terminal). All cells consist of two metal terminals connected to the reacting substances. Between them is a conducting paste that allows **charges** to **flow** through the cell when it is **connected** to a circuit.

The **amount of energy** that a cell can **produce** is called the **potential difference** or **voltage**. It is measured with a **voltmeter** and is measured in **volts (V)**.

Please **highlight important points** as you go through this with your teacher!
