Show that the sample mean satisfies the recursion formula

$$\langle X \rangle_n = \langle X \rangle_{n-1} + \frac{X(n) - \langle X \rangle_{n-1}}{n}, \quad \langle X \rangle_0 = 0.$$

1.36. Suppose that the signal $\cos 2\pi t$ is sampled at random instants of time.
(a) Find the long-term sample mean.
(b) Find the long-term relative frequency of the events "voltage is positive" "voltage is less than $-\frac{1}{2}$."
(c) Do the answers in parts a and b change if the sampling times are periodic and taken every 1 second?

1.37. In order to generate a random sequence of random numbers you take a column of telephone numbers and output a "0" if the last digit in the telephone number is even and a "1" if the digit is odd. Discuss how one could determine if the resulting sequence is "random." What test would you apply to the relative frequencies of single outcomes? Of pairs of outcomes?

CHAPTER 2 Basic Concepts of Probability Theory

This chapter presents the basic concepts of probability theory. In the remainder of the book, we will mostly be further developing or elaborating the basic concepts presented here. You will be well prepared to deal with the rest of the book if you have a good understanding of these basic concepts when you complete the chapter.

The following basic concepts will be presented. First, set theory is used to specify the sample space and the events of a random experiment. Second, the axioms of probability specify rules for computing the probabilities of events. Third, the notions of conditional probability allow us to determine how partial information about the outcome of an experiment affects the probabilities of events. Conditional probability also allows us to formulate the notions of "independence" of events and of experiments. Finally, we consider "sequential" random experiments that consist of performing a sequence of simple random subexperiments. We show how the probabilities of events in these experiments can be derived from the probabilities of the simpler subexperiments. Throughout the book it is shown that complex random experiments can be analyzed by decomposing them into simple subexperiments.

2.1 SPECIFYING RANDOM EXPERIMENTS

A random experiment is an experiment in which the outcome varies in an unpredictable fashion when the experiment is repeated under the same conditions. A specific experiment is specified by stating an experimental procedure and a set of one or more measurements or observations.

Example 2.1

Experiment E_1: Select a ball from an urn containing balls numbered 1 to 50. Note the number of the ball.

Experiment E_2: Select a ball from an urn containing balls numbered 1 to 4. Suppose that balls 1 and 2 are black and balls 3 and 4 are white. Note the number and color of the ball you select.

Experiment E_3: Toss a coin three times and note the sequence of heads and tails.

Experiment E_4: Toss a coin three times and note the number of heads.

Experiment E_5: Count the number of voice packets containing only silence produced from a group of 5 speakers in a 1-msec period.
