

Switch Off inspiration and start expiration; adjust the normal rate of breathing.

Role of the Vagus nerve: (Hering Breuer or Lung Inflation reflex)

Stimulus: lung inflation

Receptors: stretch receptors in the lungs

Afferent: inhibitory signals through the vagus nerve

Center: DRG and APC

Response: stop inspiration and start expiration (together with the signals from PNC)

Importance:

- In animals, this reflex adjusts the normal rate and depth of respiration at normal tidal volume.
- In humans, it is important only in cases of high rates and depths of respiration (exercise, when TV increases to more than 3 times normal).

Genesis of normal respiratory rhythm

1. Respiratory rhythm is probably initiated from pacemaker cells in the pre-Bottzinger area.
2. The medullary centers alone can maintain automatic respiration; however, such respiration will be irregular.

1. The activity is modified by the pontine centers. However, the normal steady breathing can normally continue.
2. Apneustic center sends back stimulating discharge to the DRG which send descending path to the motor neurons supplying respiratory muscles leading to inspiration.
3. The back discharge is inhibited by vagus impulses coming from the stretch receptors and strong inhibitory impulses via vagus nerve.
4. The normal respiration is a result of an interplay between the vagus nerve and the respiratory center.

Experimental Evidence (Fig 10)

A. Cutting the vagus nerve

1. Respiration becomes slower and deeper.
2. The reason that vagus inhibitory afferents contribute to adjustment of normal tidal volume and rate of breathing is unclear.

B. Transection of the lower part of different nuclei

Lead to cut the upper border of the nuclei

Respiration is not affected. This is because all respiratory centers are intact.

Lead to cut the ventral part between DRG and DRG

Exam Respiratory System
